CONCORDIA

BEVERAGE SYSTEMS

TECHNICAL SUPPORT

Xpress Overview

Xpress Components

Front Panel Touch Pad

The front panel touch pad provides a user interface for selecting and pouring drinks.

Electrical Enclosure and CPU

The electrical enclosure houses the CPU, AC drawer, and DC board.

Bean Hoppers

Each bean hopper holds whole espresso roast beans and feeds the beans to the grinders.

Water Pump and Motor

The water pump regulates the water pressure to 135-140psi during the espresso extraction process. The motor supplies power to the pump.

Hot Water Tank

The hot water tank stores and heats the water used to brew espresso.

Brew Group

The brew group assembly brews espresso and automatically discards the used coffee into the grounds bin.

Steam Tank

The steam tank provides steam used for steaming the milk.

Grinders and the Grinder Adjustment Assembly

The grinders are calibrated to grind espresso beans according to the customer's recipe. The grinder adjustment assembly changes the grind of espresso beans.

Exhaust Fan

NOT SHOWN

The exhaust fan removes excess heat build-up from the machine interior.

Refrigeration Unit

The refrigeration unit stores the milk used for drinks.

Refrigeration Module Assembly

The refrigeration module assembly regulates the temperature inside the refrigeration unit.

Milk Pump and Milk Pump Box Assembly

The milk pump assembly draws milk from the milk container.

Syrup Manifold

Xpress 6 only

Flavor is infused into drinks via the syrup manifold.

Product Delivery Bracket

The product delivery bracket holds the milk bowl (not shown) and the syrup manifold.

Product Delivery Nozzle

The finished drink is poured through the product delivery nozzle and into the customer's cup.

Flavor System Overview

Flavor System Components

Xpress 6 only

Pump Unit

The pump unit contains the six peristaltic pump assemblies that move the flavors from the boxes to the syrup manifold, and then to the product delivery outlet.

Control Unit

The control unit houses the electronic board that controls the syrup pumps.

Power Supply

The power supply provides 24Vdc power to the control unit.

Chocolate Heater Assembly

The chocolate heater assembly provides heat to the chocolate sauce, to ensure a minimum temperature of 85°F (29.4°C) is maintained.

CONCORDIA
BEVERAGE SYSTEMS

Technical Specifications and Site Requirements

To ensure the site is ready, the customer is required to complete and return a pre-installation checklist. The customer is required to have electrical, water, and a drain located within a specified distance from the machine.

Technical Specifications

| | |
|-------------------------------|---|
| Weight: | 300lbs/137kg |
| Operating Environment: | 55°- 85°F (13°-29°C) |
| Power Consumption: | 24 amps @ 208Vac max 8 amps @ 115Vac max |
| Compliance: | |
| FCC: | Part 15B, Class A, Part 68 |
| UL Listed | |
| NSF Certified | |

Location Requirements

Locate indoors only

Overall Space

23.79"W x 26.75"D x 36.13"H
59.64cm x 67.49cm x 91.44cm

Machine Counter Space

36"W x 29"D x 42"H
91.44cm x 73.66cm x 106.68cm

Flavor Delivery System

30"W x 30"D x 27"H
76.2cmWx76.2Dx68.6H

Drain

Connection for ¾"/1.9cm drain dose
Indirect drain required
Located within five feet/1.5 meters of machine

Power and Water Requirements

Power

Located within five feet (1.5 meters) of machine

Single Phase:

200-240Vac, 30amp dedicated circuit

NEMA L14-30 Receptacle

High Leg:

200-240Vac, 30amp, high leg dedicated circuit.

International machines are shipped without a power plug. A plug must be attached at the time of installation and meet with all local electrical codes.

Flavor Delivery System

Domestic

Chocolate Heater Assembly

115Vac, 15amp

NEMA 5-15P

Control Unit

115Vac, 15amp

NEMA 5-15P

International

Chocolate Heater Assembly

230Vac

Control Unit

90-260Vac

Water

Cold water source with a 1/4" or 3/8" tube fitting with a shut-off valve, located within five feet (1.5 meters) of machine

Pressure

Minimum: 30psi; Maximum: 100psi (min: 2 bar, max 7 bar)
25 gallons per hour (95 liters per hour)

A fresh water bypass is required for sites with a reverse osmosis filter system

Scalex Water Treatment System

Included with the unit: two cartridges (one carbon, one softener)

25"H x 11"W x 5.25"D

63.5cmHx28cmWx13.34cmD

Machine Dimensions

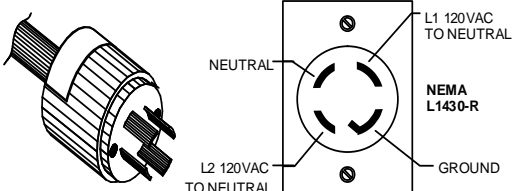

Installation

Configuring the Machine for Supply Voltage

Before connecting machine to the electrical supply, check and verify incoming power supply. The following chart displays the required voltages.

Plug and Receptacle – US only

Xpress equipped with 4 prong 208 volt plug

Confirming Receptacle Voltages

| Connections | Voltage |
|-------------------|-----------------|
| L1 to Ground | 110Vac – 120Vac |
| L2 to Ground | 110Vac – 120Vac |
| L1 to Neutral | 110Vac – 120Vac |
| L2 to Neutral | 110Vac – 120Vac |
| L1 to L2 | 200Vac – 240Vac |
| Ground to Neutral | 0Vac |

Espresso Machine Electrical Settings

Prior to connecting the machine to the power source, verify the electrical settings are correct. The DC jumper plug and transformer must be properly configured.

WARNING: Failure to properly set the DC jumper plug and the transformer connector can result in machine malfunction, short circuit, blown fuses, overheating, or damage to circuit boards.

Setting the DC Jumper Plug

1. Measure the source voltage at the NEMA L1430-R receptacle (refer to the chart above). Record the value in the electrical section of the installation checklist.
2. Remove the electrical enclosure cover to access the DC power supply board.

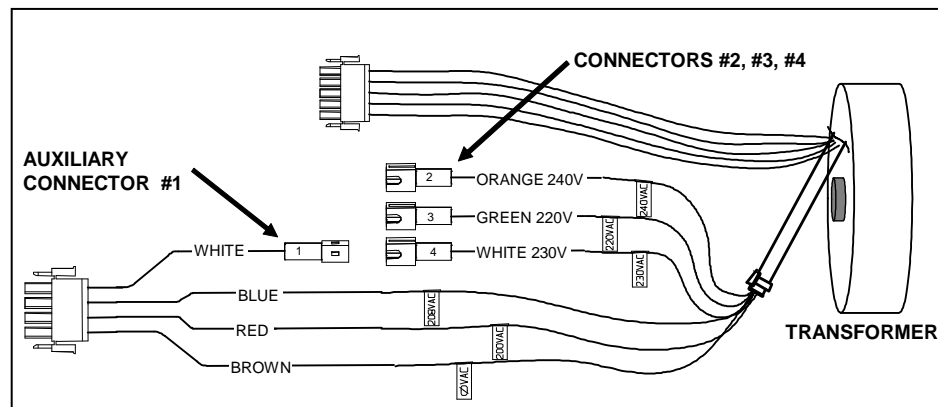

CAUTION: ESD protection required.

3. Remove the DC power supply board using the white ejector lever.
4. Use the diagram on the next page to configure the DC jumper plug to the measured source voltage.
5. Insert the free end of the yellow wire into the correct pinhole.
6. Insert the jumper plug into connector J1 located on the DC power supply board.
7. Re-install the DC power supply board. Ensure the board is fully seated by firmly pressing the board into connector on the backplane connector.
8. Re-install the electrical enclosure cover and verify the display cable is not stressed, pinched, or cut when front panel is lowered.

Configuring the DC Jumper Plug**Configuring Transformer Auxiliary Connector****#1**

It may be necessary to configure the auxiliary connector at the transformer, depending on the measured supply voltage.

1. Remove the machine back panel.
2. Locate the transformer and connectors.
3. Using the voltage table, connect the transformer auxiliary connector #1 to the appropriate connector labeled 220Vac, 230Vac, or 240Vac.
4. Reinstall the back panel and proceed with machine installation.

Transformer Auxiliary Connector Configuration**VOLTAGE TABLE**

| MEASURED SOURCE CONNECTOR VOLTAGE RANGE | AUX CONNECTOR #1 | SETTING |
|---|------------------------|----------------|
| 200 – 205 | 200 | NO ADJUSTMENT |
| 206 – 215 | 208 | NO ADJUSTMENT |
| 216 – 225 | 220-240 | #3 GREEN WIRE |
| 226 – 235 | 220-240 | #4 WHITE WIRE |
| 236 – 245 | 220-240 | #2 ORANGE WIRE |

Plumbing

Connecting the External Drain

Only a qualified plumber complying with all local codes and requirements can install the drain at the site. You are responsible for connecting the machine to the drain.

The following requirements must be met:

- Drain accommodating a 3/4" (1.9cm) ID drain hose
- Drain must be located within five feet (1.5 meters) of machine

Approved Drain Configurations

The minimum rate of fall required is one inch (2.54cm) per foot, and the drain hose must have a continuous rate of fall. Ensure the drain hose is connected to the machine drain port.

If the drain has any low spots or any horizontal runs as it travels from the machine to the drain, water and other waste from the machine will back up and cause the drain hose and/or the drain tray to clog.

NOTE: When water and drain lines are connected, check for leaks.

Water Supply

To ensure proper operation of the machine, the following requirements must be met:

- Cold water source with a shut-off valve and 1/4" or 3/8" tube fitting
- Water pressure: minimum 30psi; maximum 100psi
- Water source must be located within five feet (1.5 meters) of machine
- All machines ship with a Scalex water treatment system

Prior to connecting the water filter to the machine, flush the water filtration system with 2 gallons (8 liters) of water.

Problems with Reverse Osmosis Water System

A fresh water bypass is required for sites with a reverse osmosis filter system. The machine water level sensors are inoperative when used with this system.

Flavor System

Flavor System Installation

The flavor boxes and the flavor tubes are color-coded. It is important to verify the colors are correctly matched, to ensure customers receive the desired drink and that cross-contamination of flavors does not occur.

Flavor boxes containing one gallon of syrup can be stacked. Boxes of chocolate sauce should not be stacked, as the chocolate sauce box must be on the chocolate heater assembly to ensure it maintains the correct temperature.

Prime the Flavor System

Once the flavor boxes are positioned and connected, the flavor system must be primed. Please see the *Priming the Flavor Delivery Tubes* topic in *Section 9: Flavor System*.

WARNING: The machine MUST be fully warmed up before priming the flavor system, or a false head of steam may occur in the steam tank.

Chocolate Sauce

It is necessary to pre-warm the chocolate sauce to 85°F (29.4°C) before use; otherwise, it will not flow properly.

WARNING: If chocolate sauce is not heated to the required temperature, there is a high risk of the chocolate sauce flavor tubing exploding. This is due to the viscosity of cold chocolate sauce.

NOTE: Installation cannot be completed until the chocolate sauce is at the proper temperature.

Verify Flavor Pour Rate

It is important to verify flavor volume and ensure it meets the requirements and preferences of the customer.

Please see the *Changing the Flavor Pour Rate* topic in *Section 9: Flavor System*, for information and directions for adjusting the time and volume of flavor pours.

Additional Tasks Required at Installation

Power Up the Machine

1. Close both tank drain valves
2. Ensure the electrical cord is plugged in and twist-locked
3. Ensure water is supplied to unit
4. Ensure a drain is connected to the unit
5. Start the unit by turning on the main power switch located behind the grounds bin door
6. Warm-up will take 10-15 minutes

NOTE: The grounds bin must be in place and all doors must be closed.

Install Bean Hoppers

1. Install the bean hoppers.
2. Fill the bean hoppers with fresh, whole, espresso roast beans. For information on the bean hoppers, please see *Section 6: Coffee System*.

IMPORTANT: Ensure the hopper stoppers are removed, so that the beans can be delivered to the grinder.

Install Cup Stand (Optional)

Install the cup stand beneath the product outlet.

Operational Configuration

The Xpress is configured with a default recipe. However, it may still be necessary to make minor adjustments to the grinder settings or milk levels, depending on an existing customer recipe or customer preference. For instructions on calibrating the grinder, please see *Section 6: Coffee System*, and for instructions on adjusting the milk levels, please see the *Calibration* topic in *Section 4: Software*. For instructions on adjusting flavor timings, please see *Section 9: Flavor System*.

At this time, set the time and date, using the software menu in the machine. Please see *Section 4: Software* for detailed instructions on accessing and using the **TIME & DATE** menu.

Placing Milk in the Refrigeration Unit

Place two gallons of milk in the upper refrigeration unit. Non-fat milk is placed in the rear position and regular milk (whole or 2%) in the front.

Machine Calibration

The calibration process is the same regardless if the setup includes the default recipe, or if it includes a customer-specific recipe.

To ensure the machine is properly calibrated, verify the following:

1. Water Pump Pressure
2. Espresso Extraction Times
3. Drink Temperatures
4. Drink Levels
5. Syrup Volumes
6. Taste Profile

If necessary, adjust the bean grind to achieve the appropriate extraction times.

Customer Training

Complete customer training is required at the time of installation. Refer to *Section 12: Concordia Procedures*, for complete instructions.

Customer Training Includes:

- How to turn machine on/off
- How to refill milk supply, bean hoppers, consumables
- How to select drinks and drink options
- Show location of serial number
- How to clean the machine (including cleaning cards)
- How to change flavor boxes
- How to empty the grounds bin

Installation Checklist

The installation checklist (PN 6000-075) must be completed and faxed to Concordia within 24 hours of installation.

Removal Procedures

Prepare and package machine and components following the procedure described in the Concordia Shipping Kit (PN 2900-142).

1. Record the drink **GRAND TOTAL** on the service invoice.
2. Record the machine serial number.
3. Clean the grinders.
4. Clean the brew group.
5. Run the daily clean cycle (brew group and milk system clean processes).
6. Clean the refrigeration unit.
7. Clean the flavor delivery system.

8. Clean all interior and exterior surfaces (drain tray and grate, grounds bin, cup holder).
9. Drain and disconnect the water supply, and drain the water and steam tanks.
10. Prepare the machine and components for shipping.
11. If Demo Machine: remove, clean, and pack water filtration system.
12. Ensure the *User Guide* and cleaning cards are included with the unit.
13. Coil the power cord, water supply line, and drain hose and secure with a Ty-Wrap®.

CONCORDIA

BEVERAGE SYSTEMS

Electrical Block Diagram

Fuses

Fuses are located on the lower AC board, middle AC board, DC board, and rear grinder panel.

| Location/Purpose | Fuse |
|--|--------------------------|
| Lower AC Board Two 5amp fuses protect the transformer | F1 and F2 |
| Middle AC Board Two 5amp Slo Blo Fuses protect the grinders Two 5amp Slo Blo Fuses protect pump | F1 and F2 F3 and F4 |
| DC Board Five 5amp Fuses (can shaped) protect DC components | |
| CPU, Display, and Transducer CPU, ICs, Display, AC Interface, DC Board, Hall-Effect Sensors Transducer, Display, CPU, Analog Board, Steam Tank, Level Sensor Fans, Valves, Relays, Main AC Contactor | F15 F16 F17 F18 |
| Group Motors | F19 |
| Rear Grinder Panel Two 20amp ceramic fuses per element protect the machine in the event the heating element shorts out. | Block |

Backplane

The backplane is located in the rear of the electrical enclosure.

AC Drawer Assembly

Solid state relays located in the AC drawer control AC voltage.

NOTE: Wiring not shown in diagram below.

Solid State Relay Configuration

The Solid State Relay configuration is based on the wiring configuration:

Single Phase: Two Relays

Triple Phase: Three Relays

High Leg: One Relay

Diagram is single phase configuration.

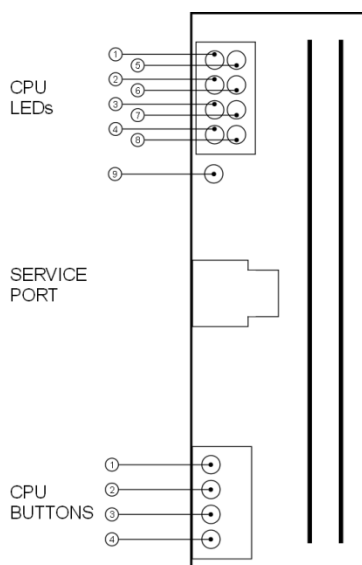

DC Board Assembly

CPU Board

The CPU board contains a series of LEDs and buttons that indicate the current state of the machine. When the green LED is illuminated, the CPU board is receiving power. When a red LED is illuminated, a particular subsystem is experiencing failure or it may be a warning condition. The display may reflect the fault.

Each CPU button has multiple functions based on the state of the machine when the button is pressed. The button may be held and the machine powered on or the button may be pressed after the machine is powered on.

| | |
|---|---|
| ❶ | CPU fault |
| ❷ | Analog board fault |
| ❸ | Front panel fault |
| ❹ | System warning or fault (will illuminate when doors/front panel are open) |
| ❺ | Boot Code Fault |
| ❻ | App Code Fault |
| ❼ | Sequence Data Fault |
| ❽ | Display Data Fault |
| ❾ | Green LED: power to CPU board |

NOTE: If ALL LEDs are lit, the software has been erased and the machine will not function.

| CPU BUTTON | POWER OFF Hold BUTTON & Turn on Power Supply and release button | POWER ON READY TO MAKE DRINK Press CPU BUTTON | ADDITIONAL FUNCTIONS |
|-------------|--|--|---|
| Top ❶ | Load factory defaults | No current function | N/A |
| ❷ | Front panel keyboard test mode | Two Functions 1. Load factory defaults 2. Reset PM counter | 1. Press button once to enter READY MODE , regardless of message for group, water, or steam temperature. 2. Must be in the MISCELLANEOUS category to access. |
| ❸ | Inhibit auto-run of brew group initialization | Initialize brew group | At times, inhibiting brew group initialization is required. |
| ❹ Bottom | Load software (Press button 1 at the same time) | Reserved (no current function) | Reserved. Factory use only. |

J4**J2**

P3**P4**

Peripheral Connections Configuration

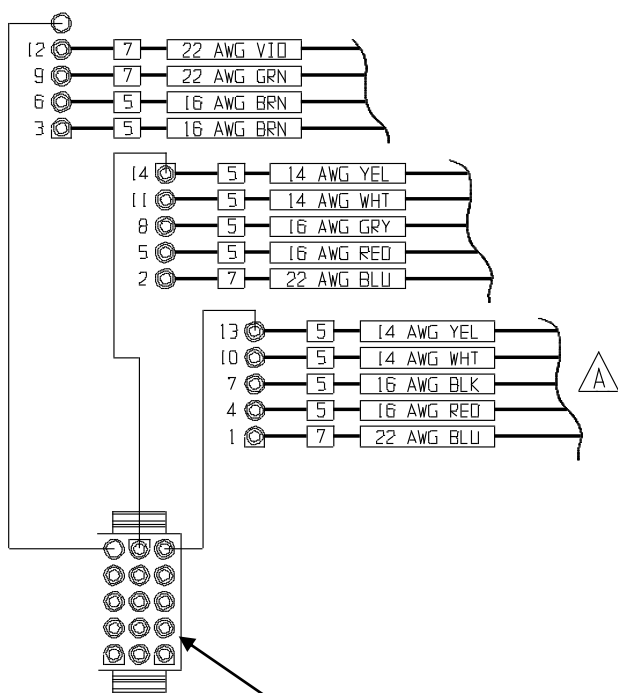

Transformer

The step down transformer uses two lines of AC voltage totaling 200-240Vac, and steps down that voltage to many separate lines of reduced AC voltage.

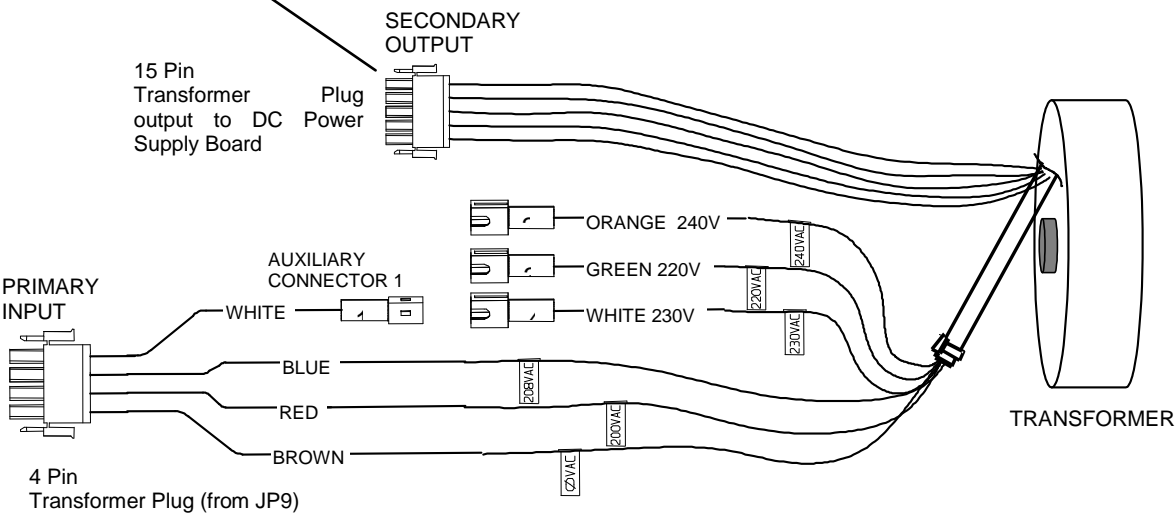

The machine will not operate correctly unless the jumper plug (located on the DC power supply board) and transformer connectors are set to line voltage.

Transformer Diagrams

Secondary Voltage on Transformer Output Plug (15 Pin)

| Wire Color | Transformer Output Voltage | Fuse | DC Power Supply Output Voltage |
|--------------|----------------------------|---------|--------------------------------|
| Violet Green | 13.4Vac | 15 | -12Vdc |
| Blue Blue | 13.4Vac | 17 | 12 and 15Vdc |
| Brown Brown | 20.6Vac | 18 | 24Vdc |
| Red Red | 30.0Vac | 19 | 38Vdc |
| White Yellow | 10.3Vac | No Fuse | 11Vdc |
| Gray Black | 9.3Vac | 16 | Ref 5Vdc & Vcc |

Machine Operating Voltage

The minimum electrical requirements must be met to ensure proper operation of machine:

- 200-240Vac
- Single Phase: 30amp dedicated circuit
- NEMA L14-30 receptacle, a four wire circuit with a neutral leg (U.S. machines are typically wired for single-phase operation)

AC Voltage

Three components in the Xpress operate on AC voltage:

| | |
|----------|------------------|
| P | Water Pump Motor |
| E | Heating Elements |
| G | Grinders |

DC Voltage

All remaining components operate on DC voltage. All control voltage is DC.

Valves

All water and steam valves in the Xpress function using a negative switching circuit. Voltage is always present at the component. The drives for the valves are located on CPU board. The CPU provides the ground to close the circuit and energize the valve.

Diodes

Diodes are used throughout the Xpress electrical connections to control the flow of electricity and eliminate electric noise from feeding back into the circuitry.

Flavor System

Water Valve: 24Vdc x1

Peristaltic Pump: 24Vdc, 282rpm x6

All flavor tubes are color-coded.

Syrup Driver Power: 115Vac

Chocolate Heater Assembly: 115Vac

| Software Sub-Category | Color Code | Corresponding Flavor |
|-----------------------|------------|----------------------|
| Small Flavor 1 | Black | Chocolate |
| Large Flavor 1 | | |
| Small Flavor 2 | Yellow | Caramel |
| Large Flavor 2 | | |
| Small Flavor 3 | White | Vanilla |
| Large Flavor 3 | | |
| Small Flavor 4 | Red | Chai |
| Large Flavor 4 | | |
| Small Flavor 5 | Green | Hazelnut |
| Large Flavor 5 | | |
| Small Flavor 6 | Blue | Sugar-Free Vanilla |
| Large Flavor 6 | | |

For additional information on the flavor system, please see *Section 9: Flavor System*.

Electrical Enclosure

Located behind the left door, the electrical enclosure houses:

- ❶ Power switch
- ❷ AC drawer
- ❸ DC power supply board
- ❹ LED display on DC power supply
- ❺ CPU boards
- ❻ LED display on CPU
- ❼ CPU buttons
- ❽ Backplane
- ❾ Line voltage test receptacle
- ❿ Electrical enclosure fan

Electrical Enclosure

Electrical Enclosure Fan

Operating Voltage: 24Vdc

The fan located in the electrical enclosure is used to maintain air circulation and cool the heat sinks on the DC power supply board. When the machine is in **TEST ROUTINES**, the electrical enclosure fan remains on. The fan removes heat from the enclosure.

Power Into the Machine

Electrical Enclosure

Lower AC Drawer: Power Into the Machine

Power into DC Power Supply Board

1. Two legs of 110Vac come into the AC board via JP1 connector on the backplane.
2. AC travels down lower AC board on traces #15 and #13, through two 5amp fuses.
3. Power switch is turned on.
4. Voltage travels out traces #1 and #3.
5. One leg of power goes directly to transformer.
6. The other leg goes to the J1 located on the DC power supply board.
7. J1 and transformer connection are set to the appropriate voltage (determined at time of installation), and the voltage travels to transformer.
8. Output of the transformer plugs into JP9 at the backplane, then into the DC power supply board.
9. Power travels into DC power supply through five 5amp fuses, #15-19.
10. The DC power supply board converts the AC voltages to many legs of DC voltage.
11. DC voltages are distributed through the backplane, through JP4.
12. The backplane distributes voltage to the rest of the machine.

Power into AC Components

- Two legs of 110Vac travel down AC board on traces #13 and #15 and are tapped and routed, prior to the fuses, to the main power relay (or contactor).
- When power switch is turned "ON," DC control voltage becomes available and closes the relays.
- AC voltage travels through main power relay out traces #5 and #7 directly to the solid state relays for steam and water tank heating elements.
- Power is also tapped and routed from lower AC board to the middle AC board through JP3 (power travels through fuses, and out JP1, supplying AC power to the pump and grinders).

WARNING: Never insert or remove the AC drawer with the power switch turned on. Inserting the drawer with the machine powered causes arcing across the copper traces and will damage the board.

Setting the DC Jumper Plug (J1)

Plug and Receptacle

Confirming Receptacle Voltages

| Connections | Voltage |
|-------------------|-----------------|
| L1 to Ground | 110Vac -120vac |
| L2 to Ground | 110Vac – 120Vac |
| L1 to Neutral | 110Vac – 120Vac |
| L2 to Neutral | 110Vac – 120Vac |
| L1 to L2 | 200Vac – 240Vac |
| Ground to Neutral | 0Vac |

1. Measure the source voltage at the NEMA L1430-R receptacle.
2. Remove electrical enclosure cover to access DC power supply board.

CAUTION: ESD protection required.

3. Remove the DC power supply board using the white ejector lever.
4. Configure and insert J1 into jumper connection located on DC power supply board.

Jumper Plug is located on DC Power Supply Board

5. Use the voltage table below to set the jumper plug to the correct measured source voltage.

6. Re-install the DC power supply board.

IMPORTANT: Ensure the board is fully seated by pressing firmly on board.

7. Re-install electrical enclosure cover (verify display cable is not stressed, pinched or cut when front panel is lowered)

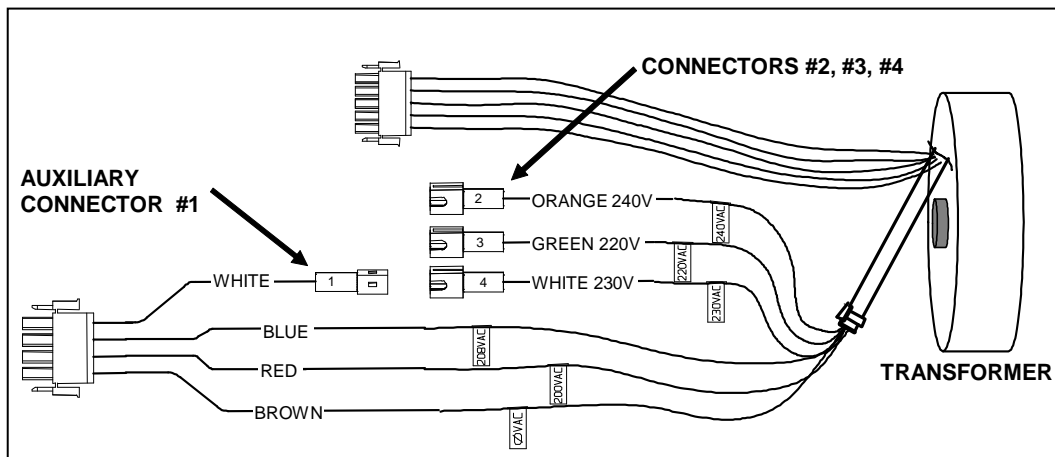

WARNING: Improper setting of the DC jumper plug connection can lead to machine malfunction, short circuit, blown fuses, overheating and/or damage to circuit boards.

Set Transformer Auxiliary Connector #1

| VOLTAGE TABLE | | | |
|------------------------------|------------------|---------------|----------------|
| MEASURED SOURCE CONNECTOR | AUX CONNECTOR | | |
| VOLTAGE RANGE | | | #1 SETTING |
| 200 – 205 | | | 200 |
| | | | NO ADJUSTMENT |
| 206 – 215 | 208 | NO ADJUSTMENT | |
| 216 – 225 | 220-240 | #3 GREEN WIRE | |
| 226 – 235 | 220-240 | #4 WHITE WIRE | |
| 236 – 245 | | | 220-240 |
| | | | #2 ORANGE WIRE |

8. If source voltage is between 200 – 215Vac, no adjustment is necessary.
9. If source voltage is between 216 – 245Vac, set transformer auxiliary connector.
10. Remove machine back panel.
11. Locate the power supply transformer and connectors.
12. Using the voltage table, connect transformer auxiliary connector #1 to appropriate transformer connector #2, #3, or #4.
13. Reinstall back panel and proceed with machine installation.

Transformer is accessible from the back of the machine

DC Power Supply Board LEDs

The LEDs on the power supply board indicate the presences of state DC voltage compared to the expected DC voltage. The LED will illuminate if there is a rise or drop in current.

| Top of Board LED Color | Voltage Represented | Associated Fuse on DC Board | Related Components |
|--|---|------------------------------------|--|
| ○ GREEN Lit during normal operation | 5Vdc | F16 | CPU, ICs, Display, AC Interface, DC Board, Hall Effect Sensors |

| ○ RED | -12Vdc | F15 | CPU, Display, and Transducer |

Heating Elements, Solid State Relays, and Fuse Blocks

Control Voltage: 24Vdc

Solid state relays control voltage going to the water and steam tank heating elements. Single phase fuse blocks use four relays and high leg blocks use two.

A fuse block containing four 20amp ceramic Slo Blo fuses protects the machine in the event of a heating element short.

Steam and Water Tank Heater Connections

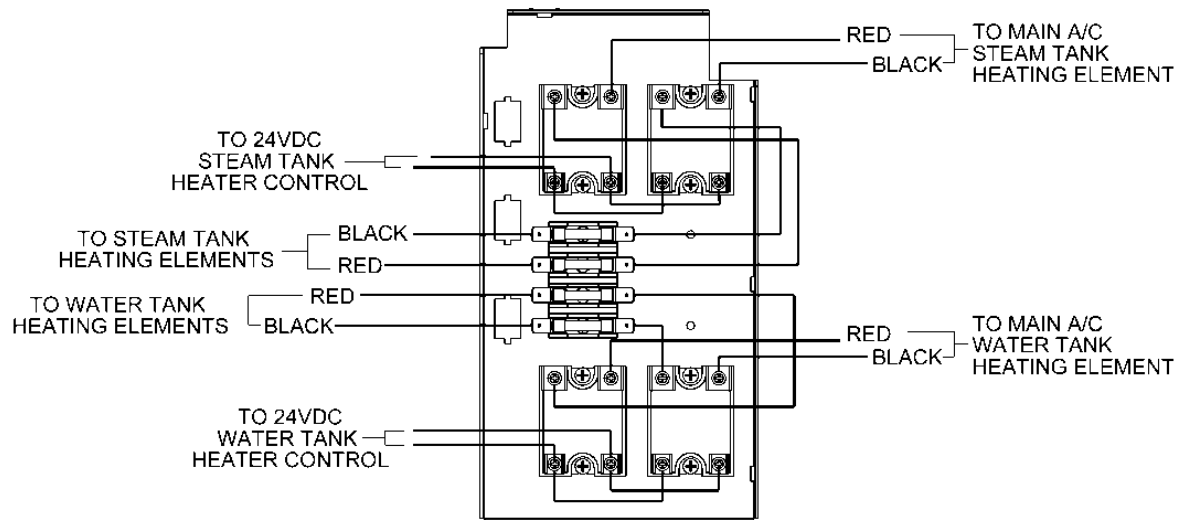

Fuse Block, CE High Leg

Heating Element Wiring Diagrams

The water and steam tank heating elements must be wired in relation to the voltage configuration supplied to the machine.

The fuse block shown below is single phase.

6. CPU Board
7. Loading New Software to a Machine

CONCORDIA

BEVERAGE SYSTEMS

Software Overview

The Xpress user interface contains drink statistics, programming access, and diagnostic service information.

Software Menu Informational Screens

GRAND TOTAL

Displays the total number of drinks dispensed.

PART NUMBER

Displays the Concordia part number of the installed software.

Categories

TOTAL DRINK COUNTS

Displays the total number of drinks poured. This number is reset only when a new CPU board is installed.

DAILY DRINK COUNTS

Displays the total number of drinks poured, by drink type, since the last brew clean.

TIME & DATE

Contains settings for the internal clock, the automatic start, and the automatic rinse features.

CHK TEMPERATURES

Displays water, refrigerator, steam, and steam wand temperatures.

SET TEMPERATURES

Changes steam, water, and refrigerator temperature settings.

COFFEE PWDR DOSE

Changes the amount of ground coffee delivered into the brew chamber. Allows the grind adjustment indicators to be turned on or off.

COFFEE PWDR PRE

Changes coffee pre-treatment settings.

SHOT SELECT

Determines the default number of shots per espresso-based drink.

WATER VOLUME

Changes the water volume for the espresso extraction and brewed coffee.

MILK TIMINGS – HOT

Changes the milk timings for all hot milk-based drinks. This menu will also display the time of the last milk clean.

MILK TIMINGS - COLD

Changes the milk timings for all cold milk-based drinks.

FLAVOR TIMINGS

Changes the flavor dosage of drinks, in seconds of pour time.

DRINK PRICES

For machines with vending capability only.

Allows prices to be set for each type of vended drink.

SPECIAL FEATURES

This category allows configuration of the following features: vending, grounds bin, grinder configuration, espresso button assignment, hot water button, extra room volume, cold drink button, milk system configuration, country, and low beans sensing.

MISCELLANEOUS

Displays the current software component version and machine ID, loads defaults, resets the Preventive Maintenance (PM) counter, and enables features such as run syrup clean.

TEST ROUTINES

Used for service diagnostic testing; each component of the machine can be tested independently.

Service Switch

Located behind the front panel, the service switch must be in the **CLEAN** position in order to access the programming menu.

Once the service switch is in the **CLEAN** position, press the **PROGRAM** button three times. The display will change from **SELECT DRINK** to **SELECT CATEGORY**.

When not cleaning the machine or accessing the software menu, ensure the service switch is in the **VEND** position.

Navigating the Software Menu

To navigate through the software menu, use the unmarked buttons below the display.

Touch Pad Menu Navigation

| | | |
|-----------------------------|------------------|---|
| PROGRAMMING MENU NAVIGATION | MENU SCROLL UP | Scroll up in category and sub-category menus. |
| | MENU SCROLL DOWN | Scroll down in category and sub-category menus. |
| | PROGRAM BUTTON | Press once for GRAND TOTAL drink statistics. Press twice to view the software part number. Press once to exit a software category. Press three times to access SELECT CATEGORY . |
| | INCREASE VALUE | Increase value in sub-category. |
| | DECREASE VALUE | Decrease value in sub-category. |

Accessing a Sub-Category

Press the rectangular **PROGRAM** button once when the desired category appears on the display, to access the sub-categories. The category will appear on the top line; the sub-category will appear on the middle line; and the value will appear on the lower line of the display.

EXAMPLE

- Viewing the **LAST MILK CLEAN** date and time
1. Press the **PROGRAM** button three times. **SELECT CATEGORY** will appear in the display.

2. Navigate to **MILK TIMINGS - HOT > LAST MILK CLEAN**.

Exiting the Menu System

To exit a sub-category, press the **PROGRAM** button once.

To exit the menu system, press the **CANCEL** button.

Accessing the Grand Total Drink Count

1. Press the **PROGRAM** button once
2. The drink **GRAND TOTAL** appears in the display

The display will automatically return to **SELECT DRINK** after a few seconds

The grand total drink statistic is only reset through the installation of a new CPU.

NOTE: Grand total drink statistics must be recorded at the start and end of each service call.

Accessing Total Drink Count Statistics

1. Press the **PROGRAM** button three times (press slowly, you will hear a beep after each press).
2. **SELECT CATEGORY** will appear in the display.
3. Scroll to the sub-category **TOTAL DRINK COUNTS**.
4. Press the **PROGRAM** button.
5. Press the **SCROLL UP** arrow to scroll through the drink count statistics.

To Exit:

1. Press the **PROGRAM** button once.
2. Press any drink button.

Accessing Daily Drink Count Statistics

Daily statistics are reset after a brew clean cycle is completed.

1. Press the **PROGRAM** button three times (press slowly, you will hear a beep after each press).
2. **SELECT CATEGORY** will appear in the display.
3. Scroll to the sub-category **DAILY DRINK COUNTS**.
4. Press the **PROGRAM** button.
5. Press the **SCROLL UP** arrow to scroll through the statistics.
6. Press the **PROGRAM** button once to exit.

To Exit:

1. Press the **PROGRAM** button once.
2. Press any drink button.

Software Quick Reference Table

The following table displays all minimum and maximum values and adjustable intervals for the software menu system.

NOTE: All machines are shipped with factory defaults. Default settings change periodically, so if you need to verify a specific default, please contact Concordia Beverage Systems for assistance at 1-800-778-0990.

NOTE: If the machine is configured for a non-US location, temperatures will be shown in Celsius and currency will be shown using either the euro or British pound symbol.

Calibration

Concordia refers to calibration as the process of adjusting the Xpress to extract the perfect drink.

The Xpress may require adjustment to perform within specific extraction parameters using the customer's choice of beans and settings. For instructions on how to load a customer-specific drink recipe, see the *Updating Software for Customers with Customer Drink Recipes* topic on page 4-30.

Calibration must be completed in the following order:

1. Pump Pressure (Plumbing System Section)
2. Coffee Powder Dose (Coffee System Section)
3. Espresso Grind (Coffee System Section)
4. Water Volume (Plumbing Section)
5. Milk Volume (Milk System and Refrigeration Unit Section)
6. Flavor Dose (Flavor System Section)

If a customer changes the type of beans they are using, their machine must be re-calibrated.

Calibration must be done with fresh espresso beans. Stale beans are dry and brittle and will grind more quickly than fresh beans. Ground espresso beans should be a bit finer than granulated sugar.

The items in the table below must be calibrated in the order listed.

Step 1: Verify Default Settings

| | |
|--------------------|---|
| Water Volume | Single 30mL |
| | Double 65mL |
| | Triple 105mL |
| Water Temperature | 198°F (92°C) |
| Coffee Powder Dose | Single: 10 grams |
| | Double: 15 grams |
| | Triple: 18 grams |
| Grind | Ground coffee particles should be a bit finer than granulated sugar |

Step 2: Visually Verify During Double Espresso Extraction

| | |
|----------------|------------|
| Water Pressure | 135-140psi |
|----------------|------------|

Calibrating Pump Pressure

This procedure must be done while extracting a double espresso.

- During the extraction, watch the water pressure gauge and ensure it maintains 135-140psi.
- If the pressure gauge does not read 135-140psi, adjust the adjustment screw, located on the water pump assembly, in quarter-turn increments (clockwise to increase setting, counterclockwise to decrease setting); the pump must be set at 135-140psi for proper brewing.
- Once 135-140psi is achieved, pour a double espresso to verify the setting.

Calibrating Espresso

If a customer-specific recipe exists, verify the recipe settings are programmed into the machine. Make any necessary adjustments and/or program them as necessary.

Configuring the Bean Hoppers

The Xpress defaults to dispensing regular and decaffeinated espresso drinks. The bean hoppers only need to be configured if the machine will not be serving regular and decaffeinated espresso drinks.

However, the Xpress can also be programmed to serve both espresso drinks and coffee drink.

1. Place coffee beans in the rear grinder.
2. Calibrate the bean grind to customer specification.
3. Navigate to **SPECIAL FEATURES > GRIND CONFIG**, and then select **ESPRESSO & COFFEE**.

To configure the Xpress to deliver only regular beans, navigate to **SPECIAL FEATURES > GRIND CONFIG**, and then select **REGULAR ONLY**.

NOTE: The **REGULAR ONLY** option will only draw beans from the front hopper. To protect the rear bean grinder, leave the empty rear bean hopper atop the machine. This will prevent debris from entering and damaging the bean grinder and brew group.

Espresso Extraction and Temperature Parameters

Unless otherwise specified, the calibration goal for the Concordia Xpress is to extract a double espresso in 18-23 seconds. The extraction time for a single shot of espresso is based on the extraction time for a double.

Once the machine has been calibrated, measure extraction time and drink temperatures to verify they are within operating parameters.

Espresso extraction times are defined as the time between the pump turning on and the pump turning off.

Espresso Extraction Time

| | |
|----------------------|---------------|
| Single Espresso Shot | 15-18 seconds |
| Double Espresso Shot | 18-23 seconds |
| Triple Espresso Shot | 23-30 seconds |

1. Press **ESPRESSO**, and then press **START** to pour a single shot of espresso.
2. Press **ESPRESSO**, press **DOUBLE SHOT**, and then press **START** to pour a double shot of espresso.

Drink Temperatures

To ensure temperature readings are accurate, temperatures for milk-based drinks must be taken in the center of a paper cup, and espresso must be taken while the espresso is being poured.

| | |
|---------------|---------------------------|
| Espresso | 175° - 195°F (79° – 91°C) |
| Latte | 160° - 170°F (71° – 77°C) |
| Mocha | 150° - 165°F (66° – 74°C) |
| Chai | 150° - 165°F (66° – 74°C) |
| Hot Chocolate | 150° - 165°F (66° – 74°C) |
| Cappuccino | 150° - 160°F (66° – 71°C) |
| Steamed Milk | 160° - 170°F (71° – 77°C) |

Verifying Espresso Extraction

1. Confirm water pump pressure is 135-140psi.
2. Verify coffee dose and water volume are set to customer expectations.
3. Pour double espresso, and record the time between the pump turning on and off.
4. Adjust grind as needed (turn grinder adjustment assembly clockwise to increase extraction time and counterclockwise to decrease extraction time).

NOTE: When making adjustments to the grind, it is important to pour three double espressos before assessing the change on the fourth double espresso pour. Four double espressos must be poured to ensure the change of grind is fully implemented.

Calibrating Milk Timings

The milk volumes must be set for each specific beverage. Milk volume is set in seconds of pour time.

Each **MILK TIMINGS – HOT/COLD** sub-category must be individually set. See the *Software Quick Reference Table* on page 4-6 for a detailed listing of settings for all hot and cold milk timings. It may be necessary to change the milk timing due to a specific customer recipe (e.g. different cup sizes).

The default drink settings are 12oz/360mL and 16oz/480mL.

To verify milk timing:

1. Place cleaning or measuring cup under product outlet.
2. Pour a single, small latte.
3. When pour is complete, verify drink level (in ounces/milliliters) in cup.

If the drink volume is correct after step three, then the milk timing for that specific drink does not need to be adjusted.

If the drink volume is too low/high, navigate to **MILK TIMINGS** and adjust the setting for that drink, as needed. Re-test the timing and drink level until it is correct, before testing other drinks.

EXAMPLE: If the drink volume is short by 1oz (30mL), increase the milk pour time by .5 second. Re-test the drink until proper volume is achieved.

Repeat this procedure for all sizes, and shot quantity, of lattes, mochas, chai latte, hot chocolate, and steamed milk.

NOTE: It is expected that there will be approximately 3/8"/10mm extra space at the top of the cup, when the drink is finished pouring. Finished drinks should not be filled to the rim of the cup.

Calibrating Brewed Coffee

The water volumes for brewed coffee are preset prior to machine delivery.

To calculate a brewed coffee volume into mL, multiply:

[the cup size in fluid ounces] x 30

One fluid ounce equals approximately 30mL.

For example, calculating the brewed coffee timing for a 12oz cup would be:

$$12 \times 30 = 360\text{mL}$$

The default settings for brewed coffee are 12oz/355mL and 16oz/475mL.

Calibrating Flavor Timings

Since customers can choose to change the flavors used for drinks, the headings in the **FLAVOR TIMINGS** software sub-category are generic. For customers without custom flavor choices, the table below displays the software generic headings and the corresponding default flavors.

| Flavor 1 | Flavor 2 | Flavor 3 | Flavor 4 | Flavor 5 | Flavor 6 |
|-----------|----------|----------|----------|----------|--------------------|
| Chocolate | Caramel | Vanilla | Chai | Hazelnut | Sugar-Free Vanilla |

For more information on how to calibrate flavor timings, please see the *Changing the Flavor Pour Rate* topic in *Section 9: Flavor System*.

Espresso Extraction Pre-Treatment Options

During pre-treatment, a small amount of water is infused into the ground beans. The grounds are then allowed to soak momentarily before the brewing process begins. This pre-infusion process enhances the quality of the espresso shot.

The Xpress has eight pre-treatment options, each varying in the specific pressure used to pack the ground beans, the amount of water used to pre-infuse, and the delay between the pre-infusion and the brewing. The pre-treatment settings for single, double, and triple shots are individually adjustable. The software category for adjustment is **COFFEE PWDR PRE**. For directions on accessing the software menus, see page 4-4.

- The default setting for a single espresso shot is pre-treatment option #4 (regular and decaf).
- The default setting for a double espresso shot is pre-treatment option #1 (regular and decaf).
- The default setting for a triple espresso shot is pre-treatment option #0 (regular and decaf).

Pre-Treatment Options

PRE-TREATMENT #0

- Pressure on the ground coffee is slightly reduced.
- No pre-infusion water added.
- No delay before brewing.

PRE-TREATMENT #1

- The ground coffee is lightly packed, and then the pressure is slightly reduced.
- Espresso grounds are pre-infused for 1/10 of a second.
- A half-second delay before brewing.

PRE-TREATMENT #2

- Pressure on the ground coffee is slightly increased.
- Espresso grounds are pre-infused for 2/10 of a second.
- A two-second delay before brewing.

PRE-TREATMENT #3

- Pressure on the ground coffee is slightly increased.
- Espresso grounds are pre-infused for 3/10 of a second.
- A two-second delay before brewing.

PRE-TREATMENT #4

- Pressure on the ground coffee is slightly increased.
- Espresso grounds are pre-infused for 3/10 of a second.
- A three-second delay before brewing.

PRE-TREATMENT #5

- Espresso grounds are pre-infused for 4/10 of a second.
- A three-second delay before brewing.
- Pressure on the ground coffee is slightly increased.

PRE-TREATMENT #6

- Espresso grounds are pre-infused for 4/10 of a second.
- A three-second delay before brewing.
- Pressure on the ground coffee is slightly increased.

PRE-TREATMENT #7

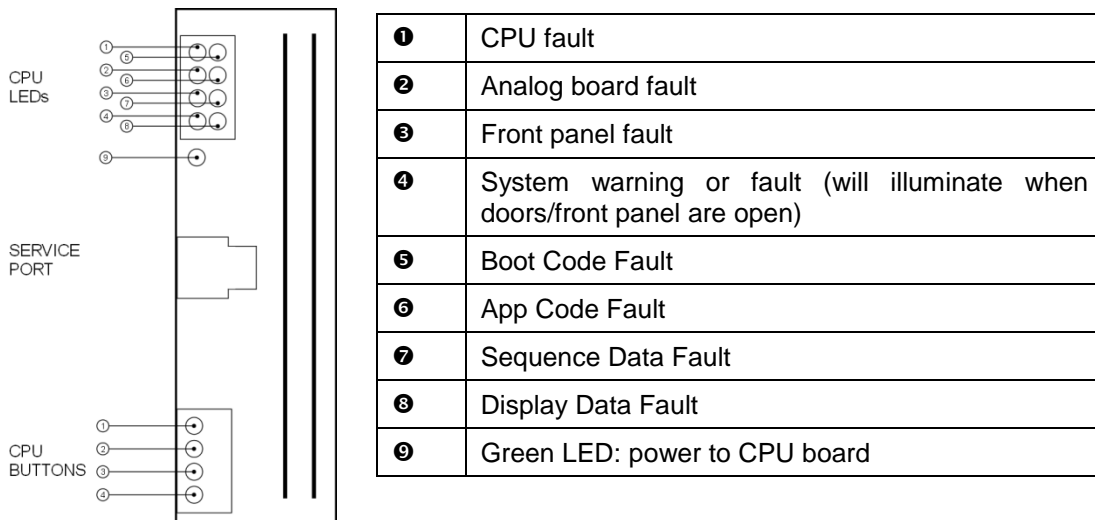

- Espresso grounds are pre-infused for 4/10 of a second.
- A four-second delay before brewing.
- Pressure on the ground coffee is slightly increased.

CPU Board

The CPU board contains a series of LEDs and buttons that indicate the current state of the machine. When the green LED is illuminated, the CPU board is receiving power. When a red LED is illuminated, a particular subsystem is experiencing failure or it may be a warning condition. The display may reflect the fault.

Each CPU button has multiple functions based on the state of the machine when the button is pressed. The button may be held and the machine powered on or the button may be pressed after the machine is powered on.

NOTE: If ALL LEDs are lit, the software has been erased and the machine will not function.

| CPU BUTTON | POWER OFF Hold BUTTON & Turn on Power Supply and release button | POWER ON READY TO MAKE DRINK Press CPU button | ADDITIONAL FUNCTIONS |
|-------------|--|---|---|
| Top ➊ | Load factory defaults | No current function | N/A |
| ➋ | Front panel keyboard test mode | Two Functions: 1. Load factory defaults 2. Reset PM counter | 1. Press button once to enter READY MODE , regardless of message for group, water, or steam temperature. 2. Must be in the MISCELLANEOUS category to access. |
| ➌ | Inhibit auto-run of brew group initialization | Initialize brew group | At times, inhibiting brew group initialization is required. |
| Bottom ➍ | Load software (Press button 1 at the same time) | Reserved (no current function) | Reserved. Factory use only. |

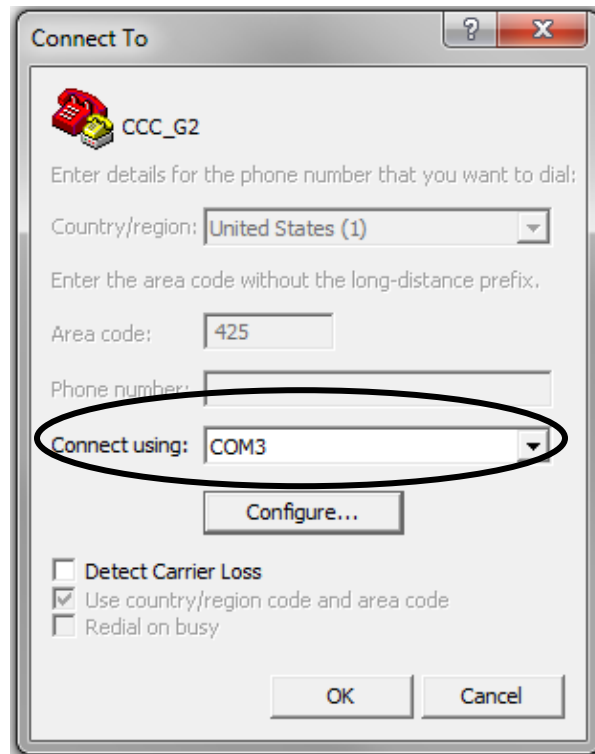

Loading New Software to a Machine

Required Equipment

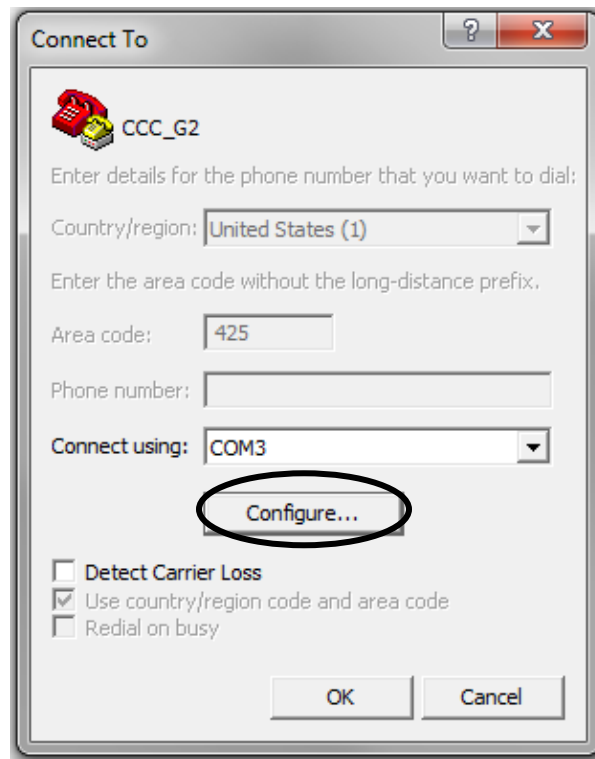

- Service port communications cable (9 pin D-sub to 6 pin modular Concordia PN 4300-013).
- An IBM compatible PC with communications software installed that supports ANSI Terminal Emulation and the XMODEM file transfer protocol.
- If using a laptop with Windows Vista or Windows 7, please visit <http://www.hilgraeve.com/hyperterminal-trial/> to purchase HyperTerminal.

Configuring HyperTerminal

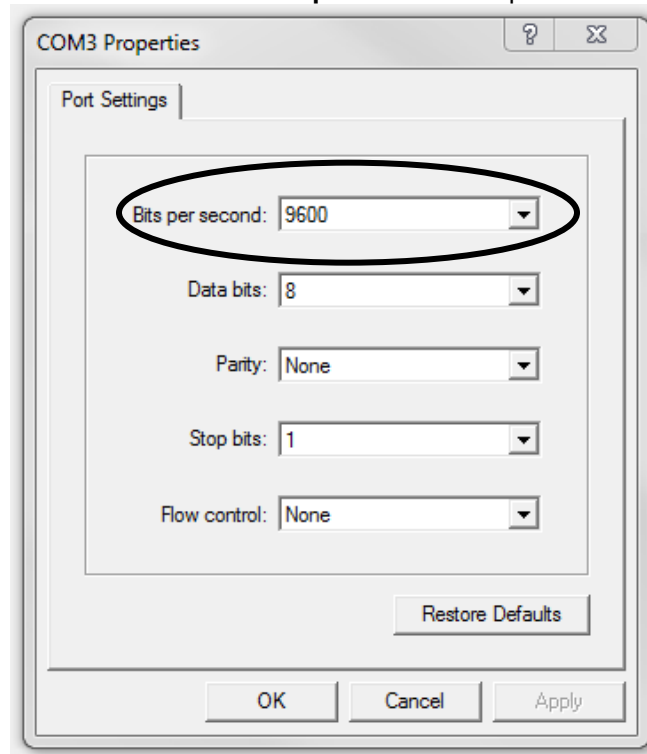

1. Open HyperTerminal.
2. Go to **File > New Connection**.
3. Select the COM port assigned to the serial adapter being used from the **Connect using:** drop-down menu.

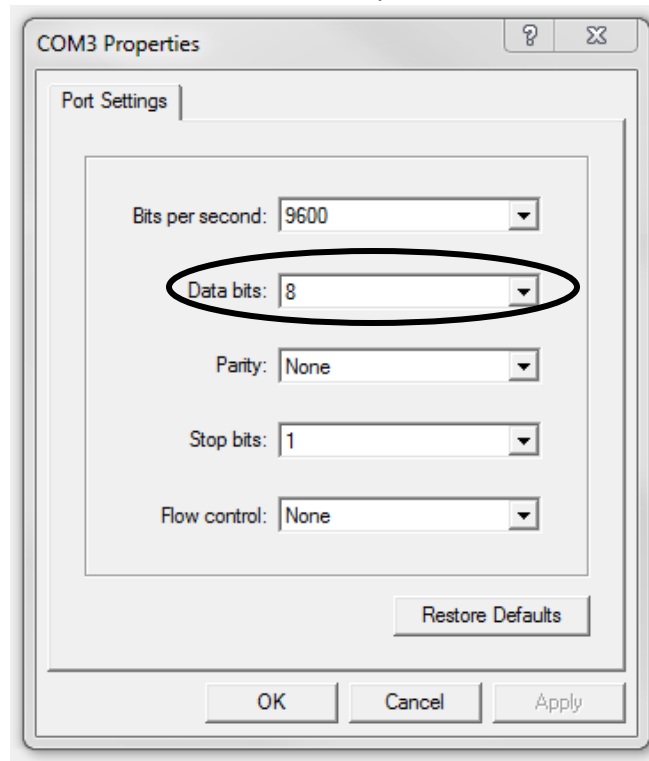

4. Click **Configure**.

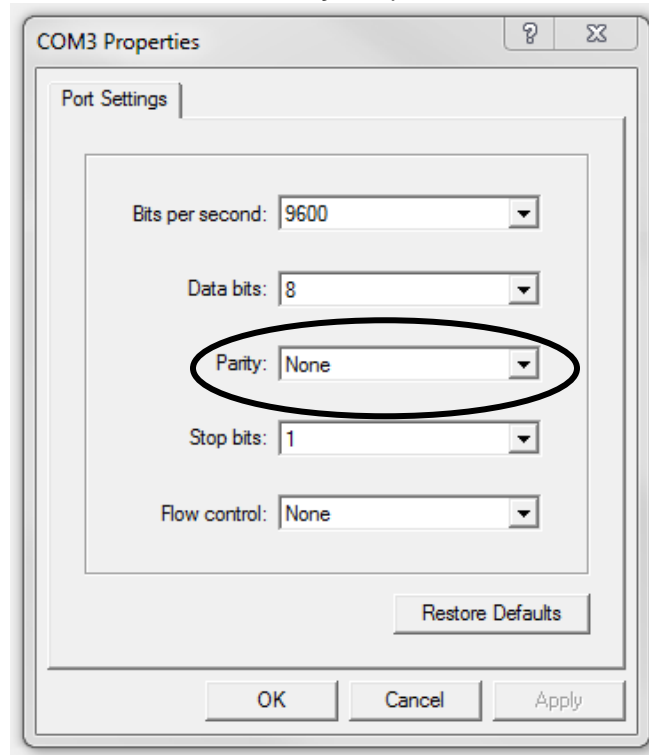

5. Select **9600** from the **Bits per second**: drop-down menu

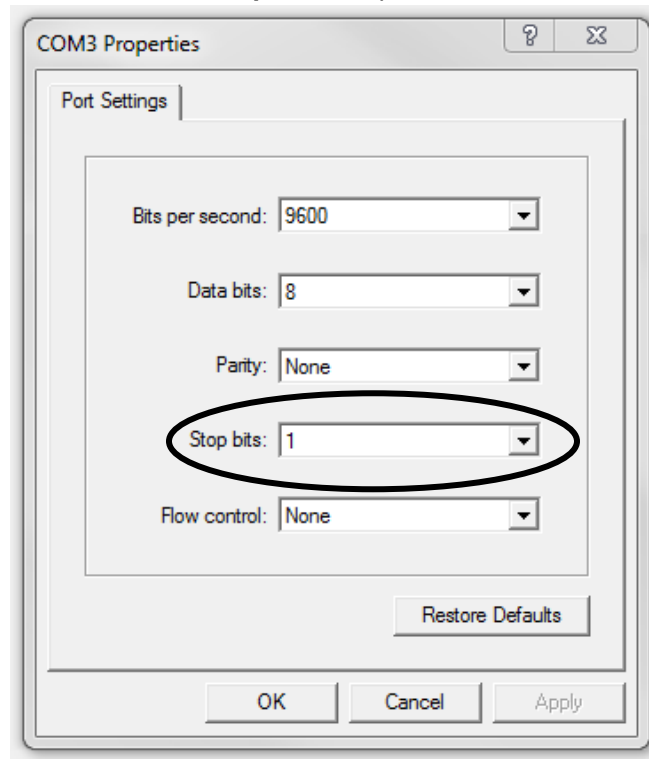

6. Select **8** from the **Data bits**: drop-down menu.

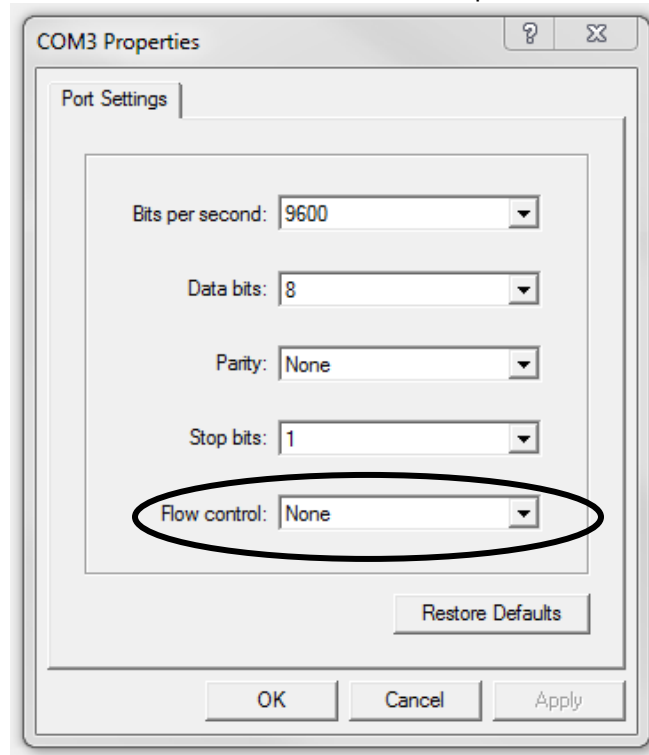

7. Select **None** from the **Parity**: drop-down menu.

8. Select **1** from the **Stop bits**: drop-down menu.

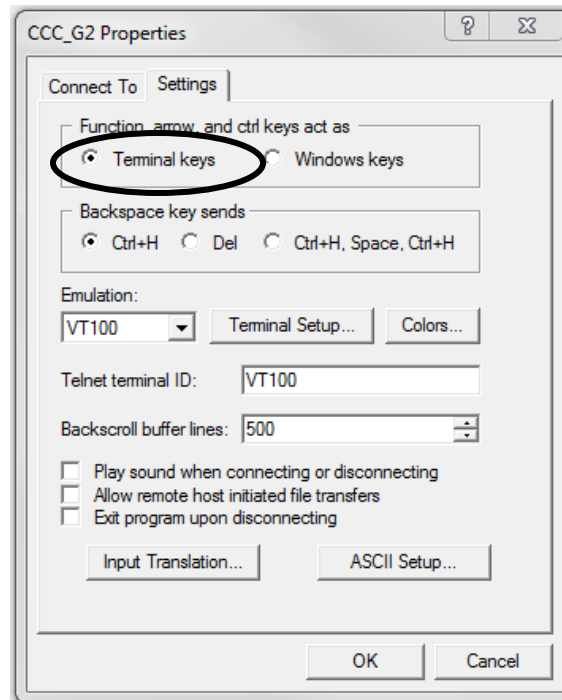

9. Select **None** from the **Flow control**: drop-down menu.

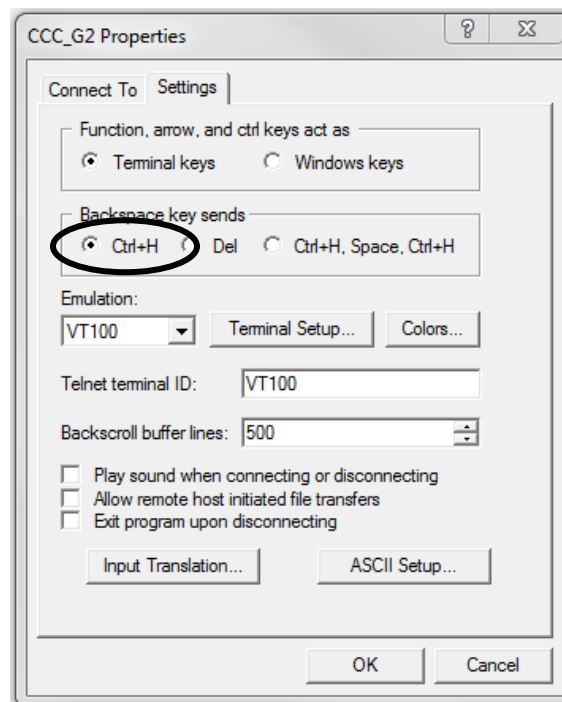

10. Click **OK**.

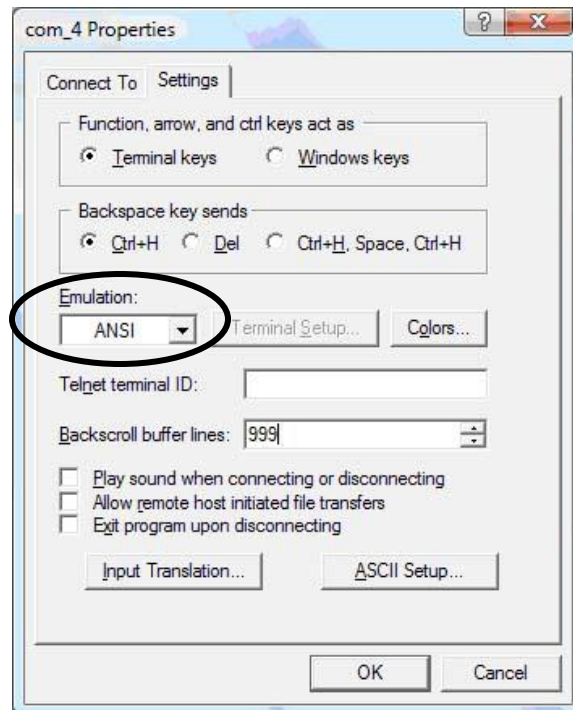

11. Select **Terminal keys** under the **Function, arrow and ctrl keys act as** section.

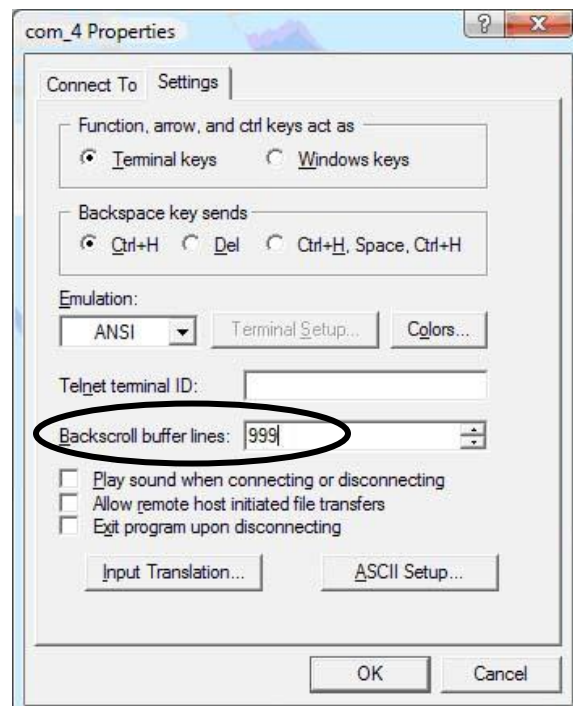

12. Select **Ctrl + H** under the **Backspace key sends** section.

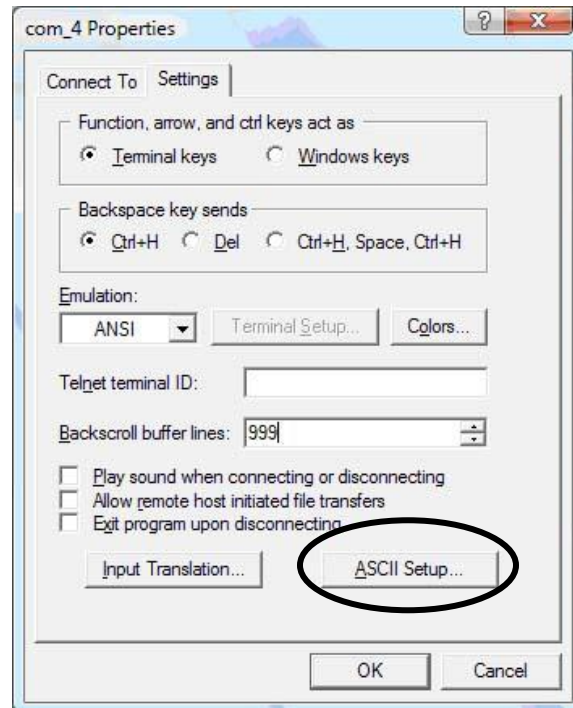

13. Select **ANSI** from the **Emulation:** drop-down menu.

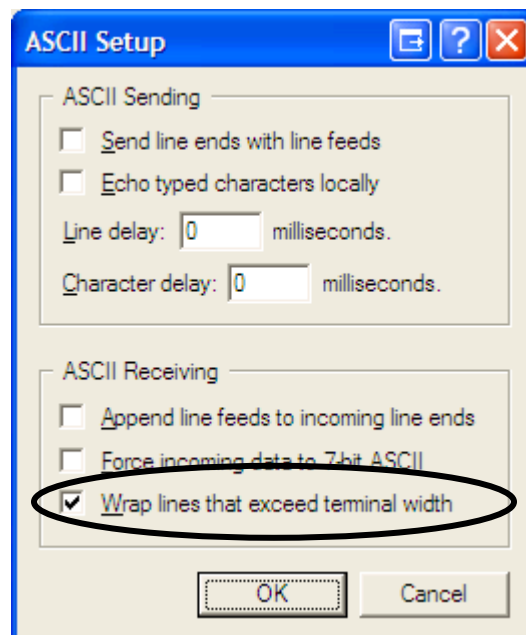

14. Enter **999** as the **Backscroll buffer lines** value.

15. Click **ASCII Setup....**

16. Check the box for **Wrap lines that exceed terminal width.**

17. Click **OK**.

18. Click **OK**.

Connecting a Laptop to a Machine

NOTE: This process is for customers using the default drink recipes. For customers with custom drink recipes, see the *Updating Software for Customers with Customer Drink Recipes* topic on page 4-30.

1. Connect the phone line end of the communications cable into the service port on the far left board in the CPU area of the machine.

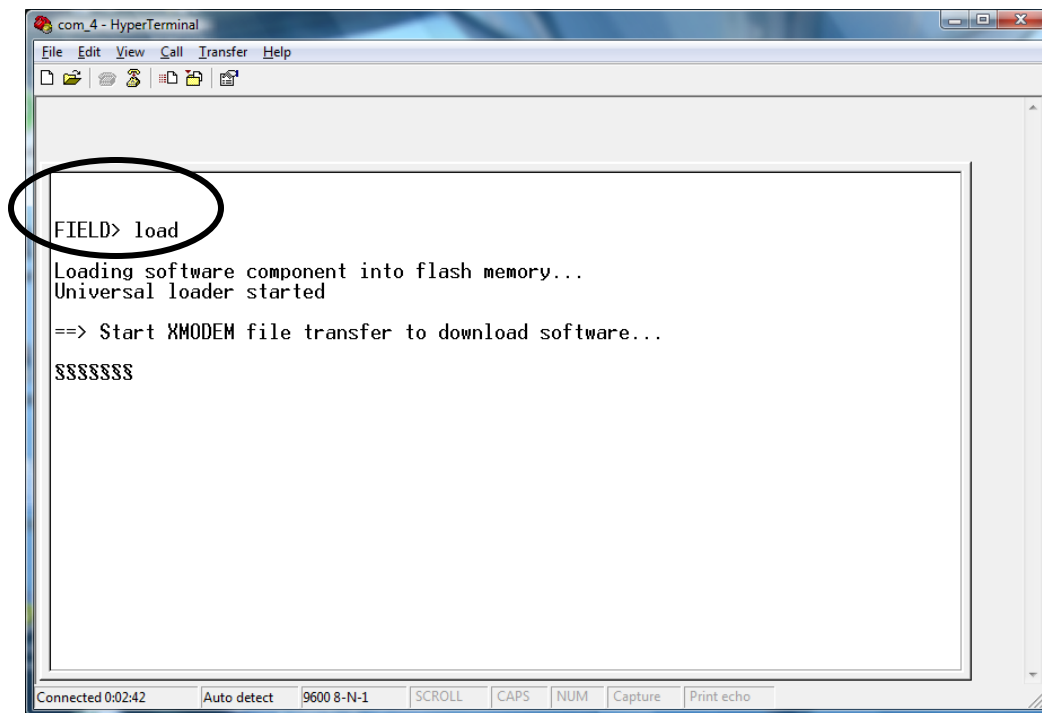

2. Connect the 9-pin D-Sub end of the communications cable into the RS232 serial port of the laptop.

NOTE: Newer laptops may require a USB-to-RS232 adapter.

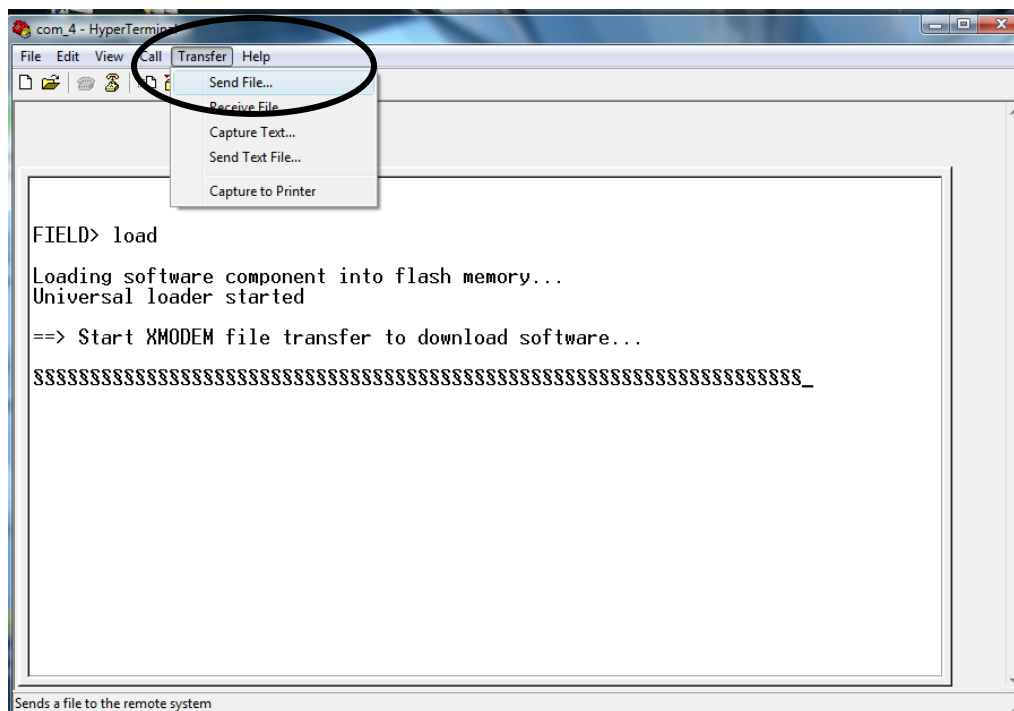

3. Press the service switch into the **SERVICE** position.
4. Open HyperTerminal and press **Enter**.
5. If the connection was successfully made, **Field** will appear in the HyperTerminal window.

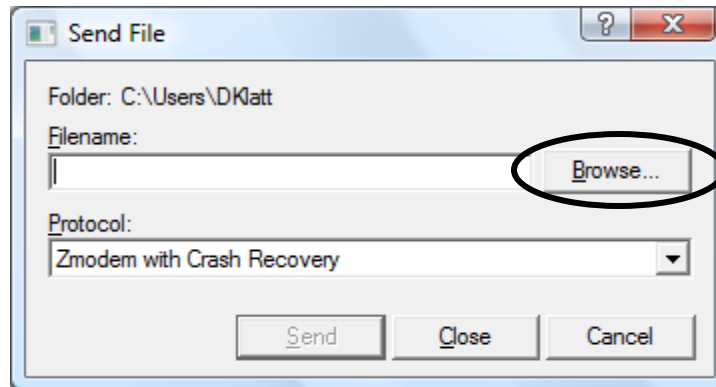

6. Type **Load**, and then press **Enter**.

7. Go to **Transfer > Send File**.

8. Select **Browse**, and then navigate to the directory with the file to download.

9. Highlight the file to download, and then click **Open**.

10. Select **Xmodem** from the **Protocol** drop-down menu.

11. Click **Send**.

NOTE: This process takes about eight minutes for an **app** file; five seconds for a **seq** file; and forty seconds for a **disp** file.

Updating Software for Customers with Custom Drink Recipes

Follow steps 1-5 of *Connecting the Laptop to the Machine* on page 4-26.

1. Type **LOAD CMD** at the **FIELD>** prompt.
2. Press **Enter**.
3. Select **Browse**, and then navigate to the directory with the file to download.
4. Select the recipe file to download.

NOTE: A recipe file has a Concordia part number as part of the file name. Ensure you select the correct part number for the customer.

5. Click **Send**.

NOTE: This process can take up to 30 seconds.

6. Check the event log afterwards to ensure the recipe file was read without errors. To access the event log, type the command "L" (without the quotes) at the **FIELD>** prompt.

NOTE: If errors are listed in the event log, call Concordia for assistance at 1-800-778-0990.

Section 5 :: Plumbing

1. The Water System
2. Hot Water Tank
3. Water Pump and Motor
4. The Steam System

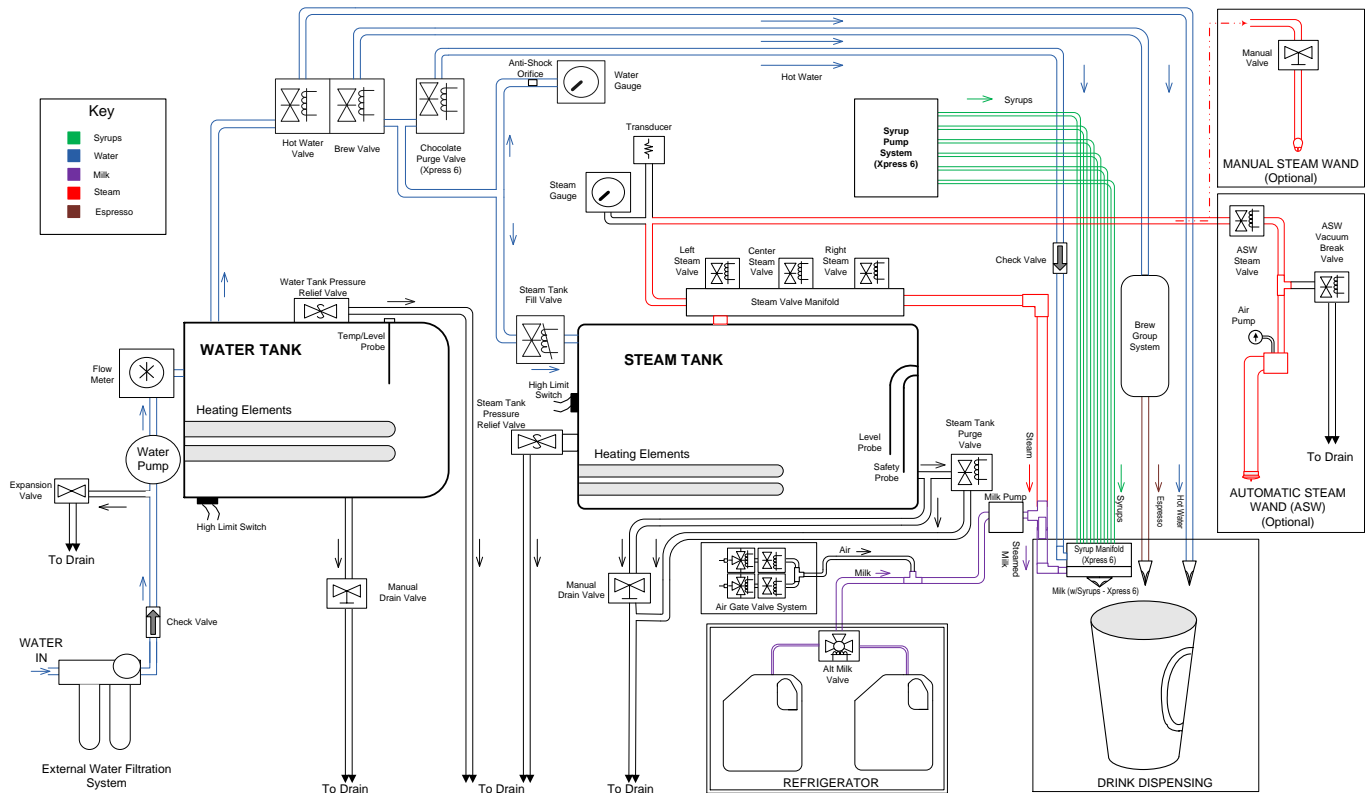

CONCORDIA

BEVERAGE SYSTEMS

The Water System

The water system provides hot water and steam for the production of drinks.

Xpress Hydraulics Diagram

Line Pressure

Pressure must be between 30-100psi at 25gph. Adequate pressure is needed to fill both the hot water and steam tanks.

Check Valve

The back-flow prevention device (check valve) is required by many state and local health codes and inhibits reverse water flow into the water supply.

Water Filtration System

The Scalex® water treatment system includes a carbon filter cartridge and a water softener cartridge.

Hot Water Tank

The hot water tank heats the water used for drinks and supplies water to the steam tank. The water tank is located behind the brew group.

Temperature/Level Probe

The temperature probe and level probe are combined into a single unit.

Level Probe

The CPU uses the level probe to verify the presence of water in the tank. To verify the presence of water, a pulsed 300mv signal is sent to the probe. The presence of water in the tank will cause the signal to shunt to ground. When the signal is grounded the CPU knows the tank has water and this allows the CPU to activate the heater (if needed).

If the signal is not shunted to ground, the CPU cannot activate the heater. If the level probe fails to detect water in the tank for a period of 60 seconds or more, the message **CHK WATER SUPPLY** is displayed. For information on troubleshooting the **CHK WATER SUPPLY** message, please see *Section 15: Troubleshooting*.

Water Tank and Level Probe Grounded

When the signal from the probe finds ground, the CPU assumes water is present in the tank.

If the water level in the tank is low and the circuit is open, the CPU activates the brew water valve, allowing line pressure to fill the tank.

Water Tank and Level Probe *Not* Grounded

When the circuit is open and the CPU detects low water, the brew water valve opens and allows water into the tank.

The heating elements are then inhibited.

Temperature Probe

The CPU uses the temperature probe to monitor the water tank temperature. The operating temperature of the tank is between 185-205°F (85-96°C). The minimum measurable temperature of this device is 146°F (64°C), while the maximum is 257°F (125°C).

- If the temperature is 146°F (64°C) or below, 146°F (64°C) will be displayed.
- If the temperature is 257°F (125°C) or above, 257°F (125°C) will be displayed.

Quick Tip

Viewing the hot water tank temperature

1. Navigate to **CHK TEMPERATURES > BREW WATER**.
2. The tank temperature is displayed.

Pressure Relief Valve

175psi

The pressure relief valve functions as a safety relief valve.

If the pressure in the water tank exceeds 175psi, the pressure relief valve opens to release excess pressure. A drain hose is routed from the pressure relief valve to the drain tray.

High Temperature Limit Switch

210°F (99°C)

In the event that the water tank temperature exceeds 209°F (98°C), the high temperature limit switch opens the control circuit to the solid state relays and cuts the voltage to the heating elements. The high temperature limit switch auto-resets, once the temperature cools, the high temperature limit switch will reset, allowing the heater to be activated.

Water Inlet

Water is supplied from the wall source to the hot water tank through the water inlet fitting.

Flowmeter

The flowmeter is used to measure water flowing throughout the system.

The flowmeter contains a Hall-Effect Sensor. As the internal impeller spins, a fixed sensor located on the top of the flowmeter detects the passing of the magnets which interrupts (pulses) the DC signal flowing to the CPU. The CPU correlates .5mL of water per pulse to determine the total volume of water passing through the flowmeter. Water passing through the flowmeter is displayed in milliliters.

Quick Tip

Viewing amount of water flowing through the flowmeter

1. Navigate to **TEST ROUTINES > BREW WATER VALVE**.
2. Activate the valve. The display will read "[X] mL" and increase as the valve is opened and water flows through the flowmeter.

Heating Elements

The water tank contains three 850 watt - 48 Ω (ohm) heating elements. Only two heating elements are used on single-phase and high leg-configured machines. Use the third heating element as a spare.

One pair of solid state relays control the AC voltage to each of the heating elements. The heating elements are wired in parallel, so when reading the resistance you will see approximately 24 Ω . Remember to isolate the element from the system prior to performing an ohms check.

Brew Valve

Operating Voltage: 24Vdc

The brew valve controls the water flow to the brew group, which is used to extract espresso. The brew valve is the top rear solenoid on the dual manifold valve assembly located on top of the hot water tank.

Hot Water Valve

Operating Voltage: 24Vdc

The hot water valve is used for dispensing hot water into the cup. The hot water valve is the top front solenoid on the dual manifold valve assembly located on top of the hot water tank.

Draining the Hot Water Tank

Prior to draining the water tank, the steam tank must be drained first. For instructions on draining the steam tank, please see page 5-15.

1. Disconnect the power supply to the machine.
2. Disconnect the water supply at the source.
3. Open the machine doors and remove the grounds bin.
4. Open the water drain valve (left side). The red handle should be vertical.
5. Loosen the line between the water tank and the brew and hot water valves. Use 1/2" wrench.
6. After the water finishes draining, tighten the line between the water tank and the brew and hot water valves. Use 1/2" wrench.
7. Close the water drain valve. The red handle should be horizontal.
8. Replace the grounds bin in the machine and close the machine doors.
9. Reconnect the water supply at the source.
10. Reconnect the power supply to the machine.

Water Pump and Motor

220Vac motor
140psi

The pump is *only* activated when brewing espresso, pouring hot water and filling steam tank. The pump *does not* inhibit line pressure or water flow. The water pump and motor is located behind the brew group and underneath the hot water tank.

Water Pressure Gauge

The water pressure gauge is located behind the front panel. As the pump is activated, the gauge will reflect the pump pressure.

The water pressure gauge does not necessarily reflect the line pressure when the pump disengages. The one-way check valve maintains an internal pressure.

Setting Pump Pressure

This procedure must be done while extracting a double espresso.

To set the pump pressure, turn the adjustment screw located on the water pump assembly. Adjust in quarter-turn increments. The pump must be set between 135-140psi for proper brewing.

Quick Tip

Viewing pump pressure

1. Navigate to **TEST ROUTINES > WATER PUMP**.
2. Activate the pump. The water gauge will display current pump pressure.

Expansion Valve

The expansion valve, located at the input side of the water pump, allows pressure to escape when the pressure within the water tank exceeds 140psi due to thermal expansion. This provides a 35psi buffer between the expansion valve and the 175psi pressure relief valve.

Check Water Flow Message

The CPU is programmed with a 60 second "time out" feature. Specific water volumes are set for each espresso extraction.

EXAMPLE: If the setting for a double espresso is 60mL and 60mL of water does not pass through the flowmeter within 60 seconds, the machine will time out and **CHK WATER FLOW** will appear on the machine's display.

To troubleshooting this error message, please see the Check Water Flow troubleshooting tree in *Section 15: Troubleshooting*.

The Steam System

The steam system heats the water that is used to froth milk for drinks. The steam tank is located in the upper right side of the machine and is accessed by removing the right side panel of the Xpress machine.

Steam Tank – Front View

Steam Tank – Rear View

Steam Tank Fill Valve

24Vdc, Solenoid type

The steam tank fill valve is located behind the steam tank and allows water to enter the steam tank.

Quick Tip

Verifying steam tank fill valve

1. Navigate to **TEST ROUTINES > STEAM FILL VALVE**.
2. Press the upper right arrow to activate the valve.

Steam Tank

Transducer

The transducer monitors the steam tank pressure. The transducer detects tank pressure, relates it to a DC voltage and transmits the voltage to the CPU. The CPU uses the information to regulate tank pressure and display an associated steam temperature. For example, 12.5psi equals approximately 244°F (118°C).

Water Level Probes

The water level probes monitor the water level inside the steam tank.

If the CPU does not detect ground through the lower safety probe, the heating element cannot be activated. Once the lower water level probe sees ground, the heating circuit is allowed to be active, if needed.

If the CPU does not detect ground through the upper safety probe, the steam tank fill valve is energized (open), allowing water into the tank until the water level reaches the upper probe, at which point the valve is de-energized (closed).

Measured voltage at the sensors when dry is 0.5Vac pulsed every second.

When wet, the lower (safety) probe will read approximately 0.006Vac and the upper (fill stop) will read approximately 0.014Vac. In **TEST ROUTINES**, the probes will read either dry or wet.

Quick Tip

Verifying the water level probes in the steam tank

1. Navigate to **TEST ROUTINES > UPPER STEAM PROBE**.
2. **WET** is displayed, if probe is seeing ground.

Pressure Gauge

The steam pressure gauge is located behind the front panel and displays current steam tank pressure.

Heating Elements

The steam tank contains two 1500 watt - 38Ω (ohm) heating elements.

The heating elements are wired in parallel, so when reading the resistance you will see approximately 19Ω . One pair of solid state relays control the voltage to the heating element.

Pressure Relief Valve

30psi

The pressure relief valve functions as a safety relief valve.

If the pressure in the water tank exceeds 30psi, the pressure relief valve opens to release excess pressure. A drain hose is routed from the pressure relief valve to the drain tray.

NOTE: Do not use the safety relief valve to release pressure from the steam tank. This weakens the valve and will cause the valve to fail.

High Temperature Limit Switch

260°F (127°C)

In the event that the steam tank should overheat, the high temperature limit switch cuts the 24Vdc control signal to the solid state relay, which opens the circuit to the heating elements.

Steam Valves

The Xpress uses three steam valves, referred to as the left, center, and right steam valves. Each steam valve operates on the same voltage and has a different orifice size for regulating the steam flow from the steam tank.

- During a latte pour, all three steam valves are activated and engaged.
- During a cappuccino pour, the left and right steam valves are activated and engaged.
- During a cold drink pour, only the left steam valve is activated and engaged.

Left Steam Valve

Operating voltage: 24Vdc
Orifice size: 0.024" (.06cm)

This valve is open for both steamed and foamed milk production and the valve remains open for a period of time after milk production is complete, to clear milk from the tubing and the milk pump.

Center Steam Valve

Operating voltage: 24Vdc
Orifice size: 0.081" (21cm)

This valve controls the flow of steam during steamed milk production, and is open the entire time steamed milk is being produced.

Right Steam Valve

Operating voltage: 24Vdc
Orifice size: .120" (0.3cm)

This valve allows additional steam to flow during foamed milk production. It is open the entire time foamed milk is being produced.

Air Purge Process

When the unit is first powered on from a cold start, it is necessary to purge the air from the tank while the water is heating. If the air is trapped within the tank, a "false head of steam" will occur and cause the machine to think it is at operating temperature, when it isn't.

To prevent this from happening, the left steam valve is activated whenever the pressure within the tank is at or below 4psi/235°F (113°C).

Captive Water Purge System

The steam tank allows water in, but only steam exits the tank allowing a potential build-up of scale inside the tank that could dramatically affect the tank performance. The purge valve, located on the front of the steam tank, opens during each brew clean cycle, flushing 0.3 liters of water through the system and removing any sediment.

IMPORTANT: The steam tank purge valve is rated at 30psi. While this valve looks similar to the steam fill valve, it is not the same. These valves are not interchangeable. Be sure to verify the psi rating on the valve solenoid prior to replacement of either the purge valve or the steam fill valve.

Draining the Steam Tank

1. Disconnect the power to the machine.
2. Disconnect the water supply at the source.
3. Open the machine doors and remove the grounds bin.
4. Open the steam drain valve (right side). The red handle should be vertical.

NOTE: It takes approximately 2-5 minutes for the steam tank to drain. When the steam tank is no longer noisy and the steam gauge displays 0psi, the steam tank is drained.

5. Close the steam drain valve. The red handle should be horizontal.
6. Replace the grounds bin in the machine and close the machine doors.
7. Reconnect the water supply at the source.
8. Reconnect the power supply to the machine.

Page Intentionally Left Blank

Section 6 :: Coffee System

1. The Coffee System
2. Grinders
3. Bean Hoppers
4. Brew Group
5. Brew Group Components
6. Gearbox Installation and Removal

CONCORDIA

BEVERAGE SYSTEMS

The Coffee System

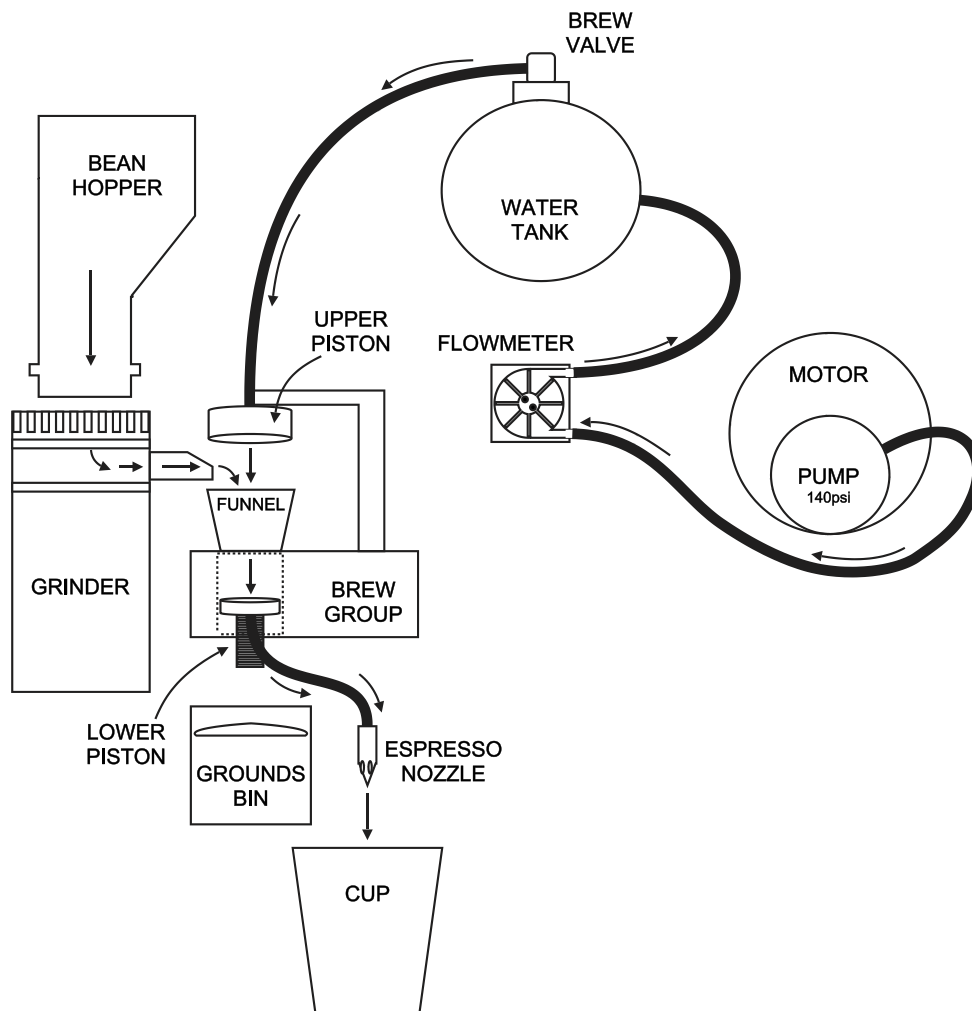

The process of delivering espresso into a cup begins with whole beans, stored in the bean hoppers, being fed to the grinders, ground to the desired consistency, and then delivered to the brew chamber within the brew group. Pressurized hot water is then introduced into the brew chamber where the coffee is extracted from the ground beans and delivered to the cup.

Only espresso-roast beans can be used in the Xpress.

Espresso Path

With ground beans in the brew chamber, the chamber is sealed and hot water (195°F/85°C) between 135-140psi is forced through the ground beans and through the lower piston. The “espresso” coffee is then directed into the cup.

After the espresso is extracted, the used grounds are directed into the grounds chute and into the grounds bin.

Grinders

Operating Voltage: 220Vac 50/60Hz

Beans are gravity fed to the grinders from the bean hoppers.

The blades (burrs) are the components which actually grind the whole beans to the desired particle size. The upper burr remains stationary as the lower burr spins and the coffee beans are ground. The burrs are made up of two identical halves: an upper and lower burr.

Double Grinder Assembly

Calibration: Espresso Grind

Over time, it may be necessary to adjust the grinder burr gap to ensure beans are ground to customer specification. The grinder adjustment panel is located behind the front panel. The grinder adjust screw is connected via cable to the grinder adjust worm gear located on each grinder.

When adjusting the grinder, turn the adjustment screw in $\frac{1}{4}$ increments.

The coffee powder channel and grinder body hold a volume of ground beans. When making adjustments to the grind, it is important to pour three double espressos before assessing the change on the fourth double espresso pour. Four double espresso pours must occur in order to ensure the change of grind is fully implemented.

It is possible to calibrate the Xpress for two different types of espresso-roast beans or for one espresso-based drink and one brewed coffee. See the *Calibrating Brewed Coffee* topic on page 4-18 for instructions. The secondary espresso bean type or beans for brewed coffee should be stored in the DECAF bean hopper and the machine needs to be programmed to access the DECAF hopper for that drink type.

Grinder Adjustment Panel

- Turning the grinder adjustment screw clockwise reduces the gap between the upper and lower burrs, resulting in a finer grind, increasing the extraction time
- Turning the grinder adjustment screw counter-clockwise increases the gap between the upper and lower burrs, resulting in a coarser grind, decreasing the extraction time

Grinder Adjustment Diagram

Measuring the Coffee Powder Dose

The CPU monitors the coffee powder dose using information obtained from the Hall-Effect sensors.

Once the beans are ground and delivered into the brew chamber, the upper piston lowers into the brew chamber to seal it. The lower piston moves up in the chamber to pack the ground coffee against the upper piston. The lower piston moves until it is stopped by the presence of the coffee in the chamber.

As the pistons move, the CPU monitors the number of motor rotations necessary to pack the ground coffee. The CPU is programmed to relate "X" number of rotations with ground coffee volume.

With each new extraction, the CPU automatically increases or decreases the grind time of the next coffee powder dose based on the amount of coffee detected during the previous extraction.

The **GRIND ADJUST** arrows provide a visual display of the CPU monitoring the coffee powder dose. The direction of the arrow indicates whether the coffee powder dose will be increased, decreased, or remain the same during the next extraction. The **GRIND ADJUST** option also activates a shot timer. After a double espresso is poured, the shot time is briefly displayed in seconds on the machine display. The **GRIND ADJUST** arrows and the espresso shot timer normally default to **OFF** when the Xpress machine is re-booted.

Quick Tip

Viewing the **GRIND ADJUST** arrows

1. Navigate to **COFFEE PWDR DOSE > GRIND ADJ ARROWS**.
2. Press the **INCREASE VALUE UP** arrow to turn arrows on.

Coffee Powder Channel

The gap between the coffee powder channel flap and the base is preset by the factory at 1/4" (6mm). If this flap is bent and the gap changes, the espresso extraction time will be negatively impacted.

Removing the Grinder

1. Turn off the machine and unplug the machine from the wall power source.
2. Insert the hopper stopper(s).
3. Remove the hopper(s).
4. Remove the machine top panel.
5. Disconnect the front panel interlock switch.
6. Disconnect the display board cable from the front panel at the CPU.
7. Remove the front panel and grounds chute.
8. Remove the left side panel.
9. Disconnect the grinder electrical connection(s).
10. Remove the grinder adjustment panel assembly from the front panel.
11. Remove the grinder front panel.
12. Disconnect the left door interlock switch.
13. Remove the three screws from the inboard bottom edge of the grinder plate.
14. Remove the three outside screws from the left vertical panel.
15. Slide the grinder mounting plate forward out of the machine.

If the grinder adjustment flex cables are disconnected, the grinder adjustment should be set to mid-scale when reinstalled.

When reinstalling the grinder, ensure the electrical harness wires are not trapped under the grinder bottom plate.

Replacing the Grinder Burrs/Blades

From time to time, grinder burrs/blades become worn and dull and need to be replaced.

1. Insert the hopper stopper.
2. Remove the bean hopper(s).
3. Remove the top panel.
4. Open the front panel.
5. Unplug the grinder.
6. Loosen the band clamp and remove the grinder adjustment assembly.
7. Rotate the burr plate counter-clockwise until removed.
8. Remove and replace the burrs.
9. Install the burr plate until the top burr touches the bottom burr.
10. Turn the top plate counter-clockwise half a revolution.
11. Re-install the grinder adjustment assembly.
12. Re-secure the band clamp.

Once these steps are completed, the grinder adjustment assembly must be reset to mid-scale, in order to continue the grinder calibration process.

Setting the Grinder Adjustment Indicator to Mid-Scale

1. Disconnect the flex cable from the coupling at the rear of the grinder adjustment screw using a 3/32 Allen wrench.
2. Turn the grinder adjustment screw until the indicator is at mid-scale.
3. Reattach the flex cable(s) to the coupling(s) and secure the set screw.

Adjust the grinder to the desired grind. It may be necessary to reset the indicator to mid-scale a second time.

Bean Hoppers

The standard bean hopper holds approximately 2lbs/1kg of beans. One bean hopper is labeled DECAF.

Filling a Bean Hopper

1. Remove the bean hopper lid.
2. Pour fresh, whole espresso-roast beans into the bean hopper.
3. Replace the bean hopper lid.

NOTE: If it is necessary to remove the bean hopper, insert the hopper stopper first. Be sure to remove the hopper stopper when finished.

| | |
|---------------|---|
| DO | Use fresh, whole, espresso roast beans. |
| DO NOT | Place ground coffee into the bean hopper. |
| DO NOT | Place foreign materials in the bean hopper. |
| DO NOT | Feed beans into the grinder by hand. |

Inserting the Hopper Stopper

The hopper stopper blocks the hopper chute when removing a full bean hopper.

1. Place the hopper stopper in the slot at the base of the bean hopper and push it into the bean hopper (see the hopper stopper card for insertion instructions).
2. With the hopper stopper in place, you can remove a full hopper from the machine.

To remove the hopper stopper once the bean hopper is back in its proper position on top of the espresso machine, simply pull the hopper stopper from the bean hopper.

Removing a Bean Hopper

Once both hopper stoppers are in place, simply lift the bean hopper upwards.

Brew Group

The brew group is the assembly where espresso is made. In the brew group, ground espresso beans are tamped and hot water is forced through the ground espresso beans. This action creates espresso, which is then transferred through the product outlet and into the cup.

After the espresso is extracted, the used grounds are directed into the grounds chute and into the grounds bin.

Two 38Vdc motors drive the double-piston brew group.

Brew Group Initialization

Each time the Concordia Xpress is turned on, the brew group runs through 22 different steps to perform a self-calibration. The CPU monitors the coffee piston movement from the base of the brew chamber to the base of the brew piston.

As the CPU monitors the piston movement based on the rotational Hall-Effect sensors and locates the fixed Hall-Effect sensors, the CPU's piston positions are reset.

Upon completion of the group initialization, the pistons move to their home position.

During operation, the pistons move past the fixed sensors and the CPU's piston positions are reset.

Brew Group Components

Right Motor

Operating Voltage: approximately 38Vdc (unloaded)

The right motor drives the right piston up and down. A set of rotational Hall-Effect sensors located within the motor send electronic pulses to the CPU. The CPU correlates "X" pulses of motor rotation to piston movement.

Left Motor

Operating Voltage: approximately 38Vdc (unloaded)

The left motor drives the left piston up and down in the brew chamber. A set of rotational Hall-Effect sensors located within the motor send electronic pulses to the CPU. The CPU correlates "X" pulses of motor rotation to piston movement.

NOTE: The left and right motors are not interchangeable because they contain different worm drive gears.

Hall-Effect Sensors

Operating Voltage: 5Vdc

Hall-Effect sensors monitor the position of the pistons.

The brew group utilizes two Hall-Effect sensor circuits to monitor the position of the left and right pistons. When a magnet passes near the sensor, the circuit opens.

The two fixed Hall-Effect sensors are mounted to the body of the brew group, with a magnet mounted on each piston. As the piston moves and the magnet passes in front of the Hall-Effect sensor, the circuit opens. The CPU uses this open circuit to verify the location of the piston.

As the piston magnet moves across the Hall-Effect sensor, the sensor LED will illuminate.

For proper function, the gap between the Hall-Effect sensor and the magnet must be a minimum of 1mm (.04") and a maximum of 2mm (.089"). For reference, a credit card is approximately 1.5mm.

Left Piston

The left piston is also referred to as the coffee piston or the lower piston. When coffee is ground and delivered into the brew chamber, the left piston moves up to pack the coffee against the right brew piston.

Right Piston

The right piston is also referred to as the brew piston or the upper piston. During an extraction, the brew water passes through this upper piston, through the ground coffee, through the coffee piston, and out of the brew chamber via tubing to be dispensed into the cup.

Piston Movement

Once the CPU detects the piston location using the fixed Hall-Effect sensors, it continues to monitor piston position using the rotational Hall-Effect sensors located in the motors.

The CPU monitors the rotations of the motor and is programmed to associate "X" number of rotations with piston movement.

Piston location viewed in TEST ROUTINES

Viewing the Left Piston Movement

1. Navigate to **TEST ROUTINES > LEFT DRIVE**.
2. Under normal operating conditions, the piston location should display approx 362-363.
3. Use the increase value/decrease value arrows to move the piston.
4. As the piston moves, the piston location number will change.
5. As the piston magnet moves across the Hall-Effect sensor, an "L" will appear on the display and the sensor LED will illuminate.

Removing the Left Piston

1. Remove the bean hoppers.
2. Remove the top panel from the machine.
3. Remove the funnel.
4. Remove the grounds chute.
5. Using a 4mm Allen wrench, remove the lower piston set screw, located at the bottom end of the lower piston nylon shaft.
6. Disconnect the brew line from the product nozzle.
7. Navigate to **TEST ROUTINES > LEFT DRIVE** and drive the lower piston up as far as it will go, then down as far as it will go.
8. Insert your hand into the brew chamber from the bottom. You should feel the bottom of the nylon shaft. Push shaft upward until lower piston head has cleared top of chamber.
9. Using a towel, grab piston head and pull upward until brew line is clear of chamber.

Removing the Right Piston

NOTE: Before performing these steps, use a marker pen to place a mark on the brass sleeve of the upper piston, to aid in properly reinstalling upper piston assembly.

1. Remove the bean hoppers.
2. Remove the top panel from the machine.
3. Loosen the screw on top of the right drive assembly and remove the pin retaining bracket and pin.
4. Lift off the upper piston assembly; inspect the microscreen (remove, clean, and re-install); lay assembly on steam tank (assembly will still be connected to brew line).
5. Replace the upper piston o-ring.
6. Using a 4mm Allen wrench, remove the helical bolt from the right side of the group assembly.
7. Navigate to **TEST ROUTINES > RIGHT DRIVE**. Drive the piston up to the upper crash position.
8. Using a towel, remove the upper piston assembly from the machine.

NOTE: The upper piston may be hot, so handle with care.

9. Replace both ring guides.
10. Reinstall the right drive assembly into the brew group, ensuring the drive assembly is correctly aligned with the bolt hole.
11. Navigate to **TEST ROUTINES > RIGHT DRIVE** and drive the right piston assembly down, allowing the helical bolt to be re-inserted and tightened.
12. Reinstall the upper piston assembly.
13. Verify the brew group operates correctly.
14. Reinstall the top panel and the bean hoppers.

Gearbox Removal and Installation

Removing the Gearbox

1. Remove the grounds chute.
2. Remove the lower piston as described on page 8-9.
3. Navigate to **TEST ROUTINES > LEFT** or **RIGHT DRIVE**, move the left and right pistons up as high as they will go (upper crash).
4. Remove the two lower spindle cover caps.
5. Remove the four gearbox mounting bolts underneath the gearbox and set aside.
6. Navigate to **TEST ROUTINES > LEFT** or **RIGHT DRIVE** and press the up arrow.

NOTE: As the motors run, the gearbox will move down and off the ends of the spindles.

7. Once the gearbox is free of the spindles, set it down on the drain tray.

NOTE: The right drive positional Hall-Effect sensor plate will no longer be secured. Note the position of sensor plate for reinstallation.

8. Go to the back of the machine and disconnect the group motor power plugs and all Hall-Effect sensor plugs.
9. Use an AMP pin remover to disconnect the red and black wires of either group motor from the shared group power plug.

NOTE: This will allow the connector to move past the hot water drain line as you pull it out from the front of the machine.

10. Pull the gearbox out from the front of the machine through the grounds chute area.

Installing the Gearbox

1. Insert the gearbox through the grounds bin area until it sits under the brew group assembly. A new/replacement gearbox comes with a new left spindle.

NOTE: Ensure all wires and connectors from the Hall-Effect sensors and motors are clear and go to the back of the machine.

2. Go to the back of the machine and insert the free red and black wires from one of the motors into the shared group power plug.

NOTE: The proper pattern of wires is black, red, black, red; as viewed from the rear of the machine. There is a reference mark on the connector for pin #1 (1=black, red, etc).

3. Plug in the group motor power plug and rotational Hall-Effect sensors plugs to the assigned plugs.
4. Hold the gearbox under the spindles.
5. Navigate to **TEST ROUTINES > RIGHT DRIVE** and press the down arrow until the right spindle starts to feed into the gearbox.

NOTE: Make sure the right positional Hall-Effect sensor plate has been properly placed.

6. Press the down arrow until the gearbox is drawn up to the brass spacers.
7. Re-check right positional Hall-Effect sensor plate location.
8. Insert the four gearbox mounting bolts up through the gearbox and finger-tighten.
9. Lower the right piston slightly and tighten the four mounting bolts.
10. Re-install the lower piston into the brew chamber and secure it to the spindle shaft, using a screw.
11. Run a brew group initialization to reset.
12. Re-install the grounds chute.

Section 7 :: Milk System and Refrigeration Unit

1. The Milk Delivery System
2. Milk Delivery System Components
3. Milk System Theory of Operation
4. Air Gate Valve Assembly
5. Alt Milk Valve
6. Steam Delivery Components
7. Refrigeration Unit Overview

CONCORDIA

BEVERAGE SYSTEMS

The Milk Delivery System

When a milk-based drink is selected, the milk pump draws milk from the milk container in the refrigerator, through the alt milk valve (if present), and into the milk pump assembly. In the milk pump assembly, air is introduced from the air gate valve assembly and mixed with milk, and then the milk and air mixture is transferred into the mixing TEE. In the mixing TEE, steam from the steam valves is introduced into the air and milk mixture, to heat the milk. The heated and frothed milk is then delivered to the milk bowl, and then dispensed into the cup via the product nozzle.

Milk Delivery System Components

Milk Pump Assembly

The milk pump assembly is located behind the gauge panel.

Milk Pick-Up Tube

The milk pick-up tube transfers milk from the milk container in the refrigeration unit to the milk pump.

Milk Pump

The milk pump uses a gear pump to draw milk from the milk container in the refrigeration unit and through the milk system. The milk pump uses a 24Vdc motor.

Milk System Theory of Operation

Basic Terminology

Milk Timings

The amount of time milk is poured for a specific drink.

Steamed Milk

Steamed milk is hot milk 160-170°F (71-77°C) with little-to-no foam that is produced to create a latte, mocha, chai latte, and steamed milk beverage (e.g. hot chocolate).

Foamed Milk

Foamed milk is warm aerated milk 150-160°F (65-71°C) used to create cappuccinos.

Flavor Adjust 1

This setting reduces the percentage of milk pour time when a beverage with one flavor is selected. The factory setting of 95 percent is acceptable in nearly all applications. It is only necessary to adjust this setting if the flavor timings are set significantly higher than the factory defaults.

Flavor Adjust 2

This setting is used to reduce the percentage of milk pour time when a beverage with two flavors is selected. The factory setting of 90 percent for a large beverage is acceptable in nearly all applications. It is only necessary to adjust this setting if the flavor timings are set significantly higher than the factory defaults.

Steam Tank Temperature (General)

The steam tank is always held at the temperature required to produce a flavored beverage. In most cases, this “standby temperature” is the steamed milk temperature plus the flavor offset.

- If a non-flavored steamed milk beverage is selected, the steam tank temperature is allowed to drop to the steamed milk temperature setting before the steam tank heater is activated.
- If a non-flavored cappuccino is selected, the steam tank temperature is allowed to drop to the foamed milk temperature setting before the steam tank heater is activated.
- At the end of the milk production the steam tank returns to the “standby temperature”.

Steamed Milk Temperature Setting

The default temperature of 241°F (116.1°C) is maintained by the steam tank during a latte or a steamed milk pour.

Foamed Milk Temperature Setting

The default temperature of 237°F (113.9°C) is maintained by the steam tank during a cappuccino pour.

Flavor Offset Temperature Setting

This setting is used to ensure that a flavored beverage is delivered at the same temperature as a non-flavored beverage. The default setting is 3°F (1.7°C) which means that the steam tank temperature will be held 3°F (1.7°C) hotter during a flavored beverage.

Initial Setup of the Milk System

During the initial setup of the milk system it is important to follow these steps in order to ensure reliable and consistent milk delivery.

1. Pour a small latte and measure the temperature of the beverage in a paper cup. The temperature should be between 160°F to 170°F (71°C to 77°C).
2. If the temperature is below the optimal range, navigate to **SET TEMPERATURES > STEAMED MILK** and increase the steam tank temperature setting, and then re-test the drink temperature. Repeat this process until the temperature is within 160°F to 170°F (71°C to 77°C).
3. If the temperature is above the optimal range, navigate to **SET TEMPERATURES > STEAMED MILK** and reduce the steam tank temperature setting, and then re-test the drink temperature. Repeat this process until the temperature is within 160°F to 170°F (71°C to 77°C).
4. Pour a small cappuccino and measure the temperature of the beverage in a paper cup. The optimal temperature should be 150 to 160°F (65°C to 71°C).
5. If the temperature is below the optimal range, navigate to **SET TEMPERATURES > FOAMED MILK** and increase the foamed milk temperature setting and re-test the drink temperature. Repeat this process until the temperature is within 150 to 160°F (65°C to 71°C).
6. If the temperature is above the optimal range, navigate to **SET TEMPERATURES > FOAMED MILK** and reduce the foamed milk temperature setting and re-test the drink temperature. Repeat this process until the temperature is within 150 to 160°F (65°C to 71°C).
7. Pour a small flavored latte and measure the temperature of the beverage in a paper cup. The optimal temperature should be 160 to 170°F (71 to 76°C).
8. If the temperature is below the optimal range, navigate to **SET TEMPERATURES > FLAVOR OFFSET** and increase the flavor offset temperature setting and re-test the drink temperature. Repeat this process until the temperature is within 160 to 170°F (71 to 76°C).
9. If the temperature is above the optimal range, navigate to **SET TEMPERATURES > FLAVOR OFFSET** and reduce the flavor offset temperature setting and re-test the drink temperature. Repeat this process until the temperature is within 160 to 170°F (71 to 76°C).

Milk System Capabilities

The Xpress milk system produces steamed milk at a rate of approximately 16.3mL per second up to 170°F (76°C) and dry cappuccino foam at a rate of approximately 10.4 mL per second up to 160°F (71°C).

A Common Milk Timing Mistake

A common mistake made when adjusting the milk volume is adjusting the timing for the incorrect drink. There are two reasons why this is so common;

1. There are 52 individual milk times that can be adjusted in the Xpress.
2. The **SHOT SELECT** settings can alter what milk time is used for a beverage.

EXAMPLE: The **SHOT SELECT** for a large latte is set to double.

In this scenario, changing the milk time for **LARGE LATTE** will have no effect on the drink the machine will produce. The milk timing must be changed via the **MILK TIMINGS - HOT > DBL LG LATTE**.

Air Gate Valve Assembly

The purpose of the air gate valve assembly is to allow a regulated supply of air to mix with the milk during the production of a milk-based drink.

The cappuccino gate valve, cappuccino air purge valve, and latte air purge valve are controlled by software, and the latte air gate valve is controlled by the milk pump.

The air gate valve assembly consists of two air gate valves and two air purge valves. During a latte drink pour, the latte air purge valve and latte air gate valves are used; and during a cappuccino drink pour, both assemblies of valves are used.

The air gate valve allows or stops air flow from the adjacent air purge valve. The air purge valve directs regulated air through the air vent needle when milk is poured or through the top port to purge residual milk after the production of a milk-based drink.

Air Gate Valves

Operating Voltage: 12Vdc

The air gate valves control the amount of air introduced into the milk pump during a milk-based drink pour. The amount of air allowed into the milk pump is controlled by software settings and the size of the air gate valve needles.

Air Purge Valves

Operating Voltage: 12Vdc

The air purge valves control the non-regulated air supply used to purge milk lines after drink production. The two air purge valves are connected in series to a single 24Vdc power source.

Air Vent Needles

The air vent needles regulate the amount of air allowed to mix with the milk and steam. During a latte pour, only one needle is engaged; during a cappuccino pour, both needles are engaged. This determines the amount of foam for cappuccino drinks.

Connection of Milk Pump Assembly and Air Gate Valve Assembly

After the milk pump draws milk into the milk pump assembly, the air gate valve assembly is activated and sends air into the milk pump assembly.

Alt Milk Valve

Operating Voltage: 24Vdc

The voltage for the alt milk valve is 24Vdc for 300 milliseconds and then reduces to 12Vdc to hold the valve in the desired state.

The alt milk valve is located within the on-board refrigeration unit and selects between the two supplies of milk (if two different milks are available). When the alt milk valve is energized, milk will be drawn from the front milk supply container. When the non-fat milk option is selected on the keypad, the alt milk valve is not energized, and milk is drawn from the rear container.

EXAMPLE: When a milk-based drink is poured, voltage is sent to the alt milk valve to select the Milk #1 (front) container. When the **NON-FAT MILK** option is selected, the valve is not activated, and milk is drawn from the Milk #2 (rear) container.

Steam Delivery Components

The steam delivery components connect the steam valves with the steam mixing TEE.

Steam Valves

Steam valves transfer steam from the steam tank into the mixing TEE. For more information, see the *Steam Valves* topic in *Section 5: Plumbing*.

The Xpress espresso machine uses three steam valves, referred to as the Left, Center, and Right steam valves.

Left Steam Valve

Operating voltage: 24Vdc
Orifice size: 0.6mm (0.025")

Center Steam Valve

Operating voltage: 24Vdc
Orifice size: 2.1mm (0.081")

Right Steam Valve

Operating voltage: 24Vdc
Orifice size: 3mm (0.120")

- During a latte pour, all three steam valves are activated and engaged.
- During a cappuccino pour, the left and right steam valves are activated and engaged.
- During a cold drink pour, only the left steam valve is activated and engaged.
- After a milk-based drink is poured, the left steam valve remains activated for 30 seconds, to clean out the tubing.

Mixing TEE Assembly

The mixing TEE assembly is where steam is introduced into the milk and air mixture.

Refrigeration Unit Overview

The espresso machine features a refrigeration unit, to house the milk used for drinks. The refrigeration unit is designed to accommodate two standard off-the-shelf 1-gallon (4-liter) milk containers.

Placing Milk in the Machine

Milk #1 is placed in front, and Milk #2 is placed in rear. When pouring a drink, the machine uses Milk #1 by default.

- DO** make sure milk pick-up tube is fed into the middle of the container.
- DO NOT** place milk pick-up tube into the milk container handle.
- DO NOT** kink or bend the milk pick-up tubes.
- DO NOT** pull excessively on milk pick-up tubes.
 1. Repeat process using front milk pick-up tube and Milk #1 container.
 2. Close refrigeration unit door.
 3. Close the front panel and menu board.

Checking the Refrigeration Unit Temperature

The temperature for the on-board refrigeration unit is always displayed in the machine's LCD.

If the on-board refrigeration unit door has been open for an extended period, it is normal that the temperature will rise. To have the refrigeration unit return to the proper temperature, close the refrigeration unit door and check the temperature in an hour. If the temperature is not correct at that time, please contact Concordia Beverage Systems at 1-800-778-0990.

Refrigeration Cooling Module Assembly

Operating current approximately 12amps

The refrigeration cooling module assembly contains three Peltier/Thermoelectric chips. A Peltier chip contains semi-conductors sandwiched between ceramic sheets. When DC voltage is applied, one side of the chip becomes extremely hot while the other side becomes cold. This causes heat to transfer from the cold side to the hot side.

The refrigeration cooling module removes heat from the interior of the refrigerator, leaving only cold air.

The chips are wired in parallel. If one chip fails, the other two will continue to function. However, the performance of the refrigerator will degrade.

There is a direct correlation between the ambient air temperature around the exterior of the machine and the temperature of the interior of the refrigerator. To achieve an interior temperature of 36°F (2°C) inside the refrigerator, the ambient air temperature outside the machine must not exceed 81°F (27°C). There is a delta of 45°F (7°C) between the ambient temperature and the temperature of the refrigeration unit. This means that if the ambient temperature is greater than 81°F (27°C), the refrigeration unit will not be able to achieve a temperature of 36°F (2°C) or cooler, and the quality of milk will be jeopardized.

Quick Tip

Viewing the current (amperage) draw of the refrigeration/cooling module assembly

1. Navigate to **TEST ROUTINES > REFR CURRENT**.
2. The current amperage across the refrigeration chips is displayed
3. If the current reading is less than 10amps, it's possible one of the Peltier chips has failed

Fan Control Board

Operating Voltage: 24Vdc

The power for the heat sink fan is controlled by the fan control board, which is mounted on the back of the Xpress, behind the steam tank. The fan control board controls the speed of the heat sink fans by monitoring the internal temperature of the refrigeration unit. As the refrigeration unit becomes colder, the fans slow, which results in quieter machine operation. When the temperature rises inside the refrigeration unit, the fan control board increases the speed of the heat sink fans. If the refrigeration unit rises above 39°F (4°C), the fan control board uses the full 24Vdc; as the refrigeration unit temperature drops, the operating voltage lowers to 10Vdc.

Cold Sink Deflector

Located at the rear of the on-board refrigerator unit, the cold sink deflector (CSD) protects the refrigerator cooling module assembly and guides air flow generated by the interior circulation fan assembly across the surface of the refrigerator cooling module assembly.

The cold sink deflector should be mounted directly under the circulation fan assembly. Faulty refrigeration temperature readings can result from:

- Too large of a gap between the CSD and the circulation fan.
- An improperly positioned CSD (e.g. a CSD allowed to rest on the floor of the refrigeration unit).

Example: Deflector off

Example: Deflector on

Interior Circulation Fan Assembly

Operating Voltage: 24Vdc

The interior circulation fans (PN 2310-031), located inside the on-board refrigeration unit above the cooling module assembly, are used to maintain air movement across the cold sinks, and to ensure a uniform temperature within the refrigerator.

Exterior Cooling Module Fan Assembly

Operating Voltage: 24Vdc

The exterior cooling module fan assembly (PN 2310-043) is located on the exterior of the refrigerator cooling module unit and it dissipates heat from the heat sink side of the cooling module.

Temperature Probe Assembly

The temperature probe (PN 2660-031) is used to measure the internal temperature of the on-board refrigeration unit. The CPU monitors the temperature and adjusts the interior temperature through powering the Peltier chips in the refrigerator cooling module.

Milk Weight Trays

The Xpress machine monitors the available milk levels using two milk weight trays. Each milk container is weighed independently. Milk levels are monitored using the milk weight trays and a notification message is displayed when milk levels are low or empty.

The milk containers sit on the milk weight trays and as the milk level drops, the milk weight tray rises, increasing the gap between the milk weight tray sensor magnet and the sensor. A low milk level of approximately 25 percent of the milk container volume will result in the **LOW MILK – FRONT** or **LOW MILK – REAR** message to be displayed.

A single, large milk weight tray is available. This milk weight tray allows for two containers of a single type of milk to be used. If a large milk weight tray is in use, ensure that **SPECIAL FEATURES > SINGLE MILK AUTO SEL** is selected.

A small milk weight tray is designed to hold a single milk container, and a large weight tray is designed to hold two milk containers or one large container.

| | |
|--|--|
| LOW MILK – FRONT | .25 gallon (.95 liter) of milk in front container remains. |
| NO MILK – FRONT | .10 gallon (.38 liter) of milk in front container remains. |
| MISSING FRONT TRAY | Tray sensors are not detecting the milk weight tray magnet. The milk weight tray is not installed correctly, is missing, or is incorrectly adjusted. |
| Similar messages appear for the rear milk weight tray. | |

NOTE: When initially inserted into the on-board refrigeration unit, the milk weight tray does not lie flat. The springs on the right hand side of the milk weight tray naturally lift the right side up about 1/4" (.64cm). With a full milk container on the milk weight tray, it will lie flat.

Small Milk Weight Tray Assembly PN 2310-027

Large Milk Weight Tray Assembly

The milk weight trays are notched to ensure they are properly placed within the on-board refrigeration unit.

Adjustment to milk level monitoring can be done by adjusting the position of the magnet. The milk level set-point in **TEST ROUTINES** can be used as a reference.

IMPORTANT: When calibrating a milk weight tray, adjust the magnet and remove the screwdriver from the milk weight tray. The presence of the screwdriver will affect the magnet and skew the count in **TEST ROUTINES**.

Adjusting a Milk Weight Tray

The milk level should be 60 ± 1 with an empty milk weight tray in place. With a full, 1-gallon (4-liter) milk container in the center of the milk weight tray, the display should read: 185 ± 10 .

1. Remove the milk container from the refrigeration unit.
2. Navigate to **TEST ROUTINES > MILK LEVEL**.
3. The display should read 60 ± 1 .
4. If the display is not 60 ± 1 , turn the adjustment screw until the display reads 60.

NOTE: Ensure the milk weight tray is properly placed in the refrigeration unit, prior to making any adjustment.

5. Place a full milk container on the milk weight tray and verify the display reads 185 ± 10 .

NOTE: The closer the milk container is to the left side of the milk weight tray, the less accurate the reading will be.

6. If either number is incorrect, remove the milk container and adjust the screw on the milk weight tray until the above numbers are achieved. If the milk count does not change, verify the sensor is operating.

Milk Level Sensors

There are two identical sensors in the refrigerator used to detect the milk weight tray magnets. One of them is shown in the diagram below.

The output signal is viewable in **TEST ROUTINES** for easy troubleshooting. An empty tray should be set to 60 ± 1 . A full gallon should read approximately 185 ± 10 .

Auto Milk Select

The Auto Milk Select feature can be enabled or disabled in the **SPECIAL FEATURES > MILK SYSTEM** category. **OFF** is the default setting for this feature.

Auto Milk Select Enabled

- If one of the milk containers is empty, the machine will automatically draw milk from the other container.
- If the rear container is empty, **NO MILK-REAR** is displayed on the LCD.
- If the front milk container is empty, **NO MILK-FRONT** is displayed on the LCD.
- The machine will not beep unless both containers are empty.

Auto Milk Select Disabled

If the chosen milk runs out during a drink pour, milk will stop being poured. The machine will not switch source milk containers during a drink pour.

- If the rear container is empty, the display will read **NO MILK-REAR**.
- If the front milk container is empty, the display will read **NO MILK-FRONT**.
- The machine will beep.

Section 8 :: Steam Wands

1. Steam Wand Overview
2. Automatic Steam Wand
3. Automatic Steam Wand Wiring
4. Replacing an Automatic Steam Wand
5. Manual Steam Wand
6. Replacing a Manual Steam Wand
7. Installing a Steam Wand
8. Cleaning a Steam Wand

CONCORDIA

BEVERAGE SYSTEMS

Steam Wand Overview

The Xpress has an optional steam wand feature. The steam wand can be used to steam liquids that cannot be run through the machine (e.g. eggnog, soy or flavored milks).

There are two types of steam wands available: the manual steam wand and the automatic steam wand. The manual steam wand uses a knob to control the flow of steam and the automatic steam wand has a touch pad for selecting the temperature and type of steam.

Automatic Steam Wand

The automatic steam wand allows a customer to select the heat and type of steam for their drink.

Automatic Steam Wand Theory of Operation

When a steam wand selection is made, steam will begin to flow through the wand and the system will begin to monitor and display the milk temperature. The temperature is displayed on the top line of the Xpress machine display.

When a frothed selection is chosen, air will be introduced near the tip of the steam wand to produce frothed milk.

When the milk reaches the preset temperature the steam flow will terminate.

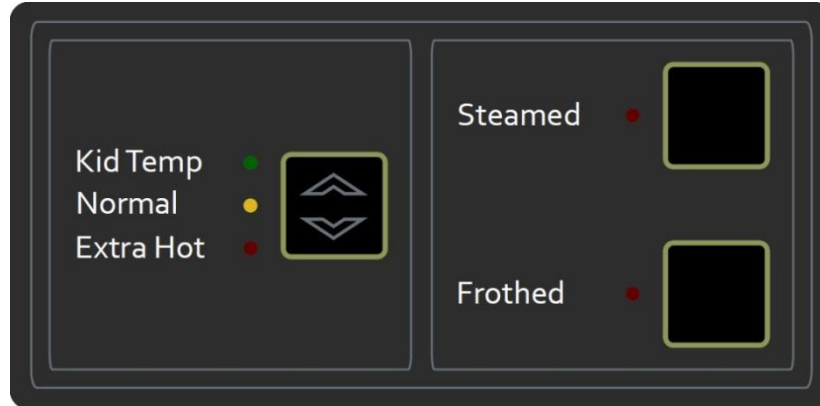

If steam wand operation and automated milk beverage are simultaneously selected the automated milk beverage will be created and the steam wand will be disabled.

The steam wand function will allow automated coffee and espresso production to occur simultaneously.

The system is capable of producing three temperature selections for both steamed milk and frothed milk

Automatic Steam Wand Selections

To select a temperature for steamed or frothed milk, press the arrow button until the desired temperature selection lights up. The liquid in the steam pitcher will be steamed or frothed until it reaches the programmed temperature for that setting. The high/low temperature settings are listed in the *Software Quick Reference Table* in *Section 4: Software*.

KID TEMP + STEAMED

A reduced temperature steamed milk will be poured.

KID TEMP + FROTHED

This selection will create reduced temperature frothed milk.

NORMAL + STEAMED

This selection will create industry standard temperature steamed milk.

NORMAL + FROTHED

This selection will create industry standard temperature frothed milk.

EXTRA HOT + STEAMED

This selection will create above standard temperature steamed milk.

EXTRA HOT + FROTHED

This selection will create above standard temperature frothed milk.

Press any steamed or frothed option button to end the manual steam process.

Automatic Steam Wand Programming

Navigate to the **STEAM WAND** software menu to complete the following tasks:

1. Enable or disable the steam wand.
2. Verify the **KID TEMP** steamed milk temperature is 130°F (54°C).
3. Verify the **KID TEMP** frothed milk temperature is 130°F (54°C).
4. Verify the **NORMAL** steamed milk temperature is 160°F (71°C).
5. Verify the **NORMAL** frothed milk temperature is 160°F (71°C).
6. Verify the **EXTRA HOT** steamed milk temperature is 175°F (79°C).
7. Verify the **EXTRA HOT** frothed milk temperature is 175°F (79°C).
8. Verify the frothed milk-air percentage is 55 percent.

The **FROTH AIR START** setting determines the amount of air used in the production of frothed milk.

Air Pump

Operating Voltage: 24Vdc

The air pump assembly adds a metered quantity of air to achieve frothed milk. It is located inside the refrigerator door assembly.

Steam and Vacuum Valve Assembly

Operating Voltage: 24Vdc

The steam valve provides steam to the steam wand.

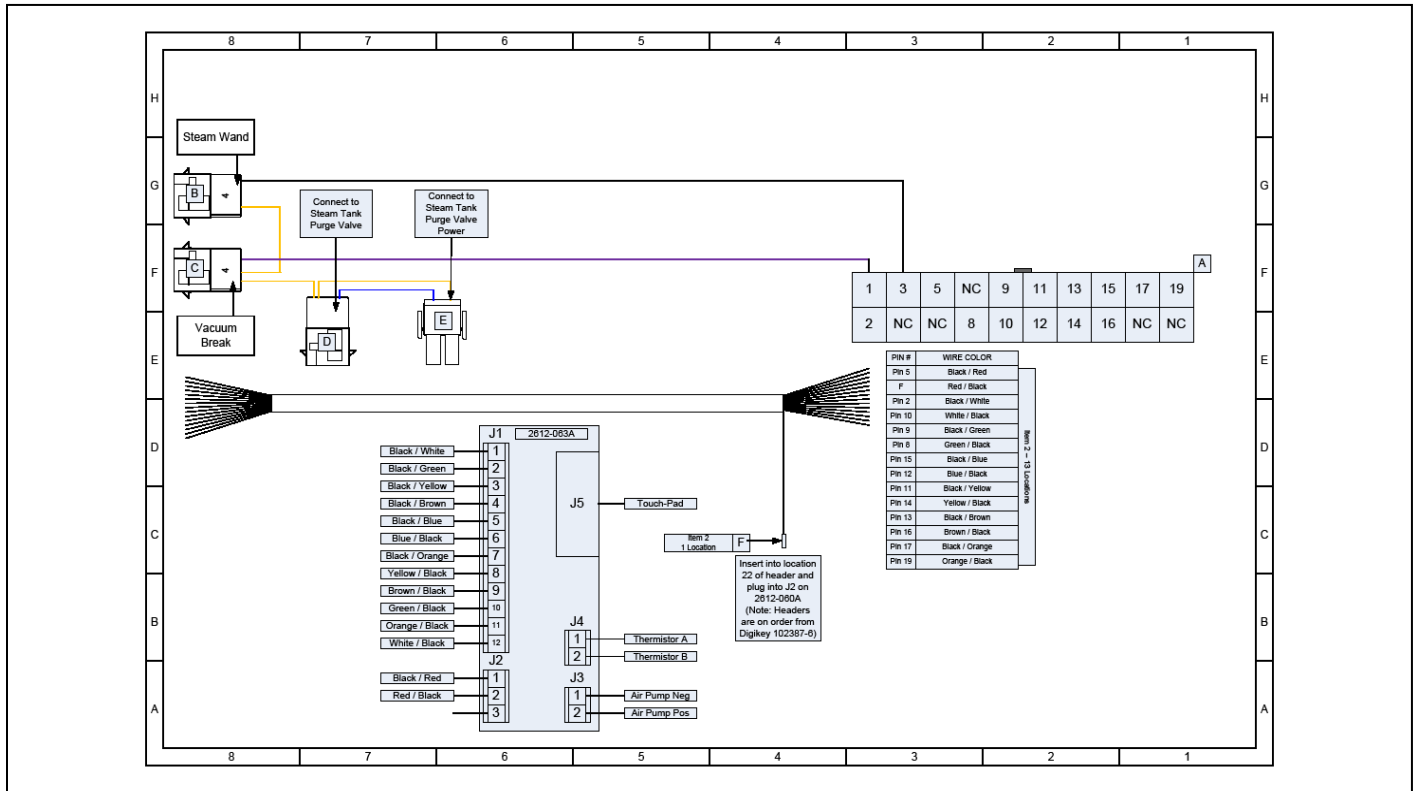

The vacuum break valve prevents milk from entering the steam system by opening the steam line to atmosphere after the steam cycle is complete.

These valves are located behind the front panel. They are attached to the interior from on the right side of the machine. To remove and replace these valves, it is necessary to first remove the right side panel.

Automatic Steam Wand Wiring

The steam wand wiring is designed to pass through the refrigerator door hinge to connect the touch-pad, air pump, and LEDs. The harness also connects the steam and Vacuum break valves to the control system and to the steam tank purge valve to provide the 24Vdc for the valves.

Replacing an Automatic Steam Wand

Typically, to replace an automatic steam wand, the entire right door of the machine must be replaced.

Call Concordia Beverage Systems for assistance at 1-800-778-0990.

Manual Steam Wand

A knob controls the flow of steam on the manual steam wand.

Replacing a Manual Steam Wand

1. Power the machine down.
2. Disconnect the water supply from the machine.
3. Purge all steam from the steam tank.
4. Remove the black steam wand knob.
5. Remove the nut, using a 7/16" wrench.

6. Remove the steam wand knob bracket, and then discard.
7. Remove the refrigerator door panel by removing the screws. Use a #1 Phillip's screwdriver.
IMPORTANT: Remove screws carefully to prevent stripping of the screw heads.
8. Separate the insulation-mounting bracket from the fridge door panel. See the photo in step 9.
9. Remove the four screws holding the refrigerator door cover. Use a Philips screwdriver. Remove the cover to gain access to the steam wand assembly.

10. Unfasten the PFA tubing at the elbow fitting. Use a 1/2" wrench.
11. Remove the four screws attaching the steam wand bracket. Use a #1 Phillip's screwdriver.

NOTE: Do not discard these screws.

12. Install the 2500 Steam Wand Assembly (PN 2790-107) provided. Use the washers (PN 1430-037) from the kit and the screws from step 11, to install the new steam wand.

Note location of flat surfaces on the valve stem

Bracket is at the lowest position.

13. Align the steam wand valve in the center opening on the refrigerator door cover. Tighten the tube fitting onto the elbow.

Valve is centered in the opening.

14. Attach the refrigerator door cover to the refrigerator door panel using the screws from step 9. Verify that the valve stem is centered in the opening on the refrigerator door cover.
15. Align the hole in the supplier handle assembly (PN 2790-106) with the hole in the lever adapter and install handle assembly. Tighten until flush. Use the long black 6-32 setscrew supplied (part of 2790-106).

16. Rotate the handle until the inner short setscrew is lined up with the notched valve section. Once aligned, tighten setscrew (part of 2790-106) to act as a stop to prevent the handle from being able to turn completely around. Check for dragging of setscrew and adjust out if needed. Turn knob to ensure it stops after about 1/4 turn.

17. Turn on the water supply
18. Turn the machine on and allow steam tank to reach operating pressure.
19. Operate the steam wand to verify operation and check for leaks.

Removing a Steam Wand

Replacing the entire right door is required if a customer requests that the steam wand be removed from their machine(s). For instructions on replacing the door, call Concordia Beverage Systems for assistance at 1-800-778-0990.

Installing a Steam Wand

Both types of steam wands are installed by the Concordia manufacturing team. Steam wands cannot be installed in the field by a service technician.

Cleaning a Steam Wand

To clean the automatic steam wand, please see the steam wand cleaning card (PN 2900-316) that comes with the machine.

To clean the manual steam wand, periodically wipe it down with a damp cloth to remove milk from the outside of the steam wand. Using a cleaner such as the Rinzer cleaning tablets (PN 3400-031) is also an option – just follow the instructions on the Rinzer container.

WARNING: Do not leave a steam wand immersed in liquid when not being used for steaming. As the pressure inside the steam tank decreases, liquid will be drawn through the inactive steam wand and into the steam tank.

Section 9 :: Flavor System

1. The Flavor System
2. Peristaltic Pumps
3. Syrup Manifold
4. Cleaning the Flavor Delivery System
5. Priming the Flavor Delivery System

CONCORDIA

BEVERAGE SYSTEMS

The Flavor System

The Espressojet® flavor delivery system delivers syrups and sauces into the cup by using peristaltic pumps to move the product from the flavor box, through the flavor tube, to a poppet valve, and then to the product delivery assembly. The amount of time the pump and valve operate is adjustable in the **FLAVOR TIMINGS** sub-category of the software menu.

The output of the poppet valve feeds the flavor into the flow of steamed milk inside the syrup manifold, where the steam, milk and syrup/sauce are infused together and then delivered into the cup.

Chocolate Sauce Delivery Path

The tube for chocolate sauce is larger than the tubes for syrups, to accommodate the thicker consistency of the chocolate sauce.

Chocolate sauce flows from the flavor box, through the chocolate sauce tube and into the chocolate poppet valve. Once the flow of chocolate sauce ends, the chocolate poppet valve closes. Milk continues to flow into the syrup manifold, to mix the chocolate sauce with the milk and to flush residual chocolate from the syrup manifold.

Before the poppet valve closes at the end of a chocolate-based drink pour, two pulses of hot water are flushed through the poppet valve, from a dedicated chocolate purge valve, to clear the poppet valve of chocolate sauce residue.

Syrup Delivery Path

The peristaltic pumps control the delivery of flavored syrup for a drink. The tubes for flavored syrups are smaller than the tube for chocolate sauce.

Flavored syrup flows from the flavor box, through the syrup tube and into the syrup manifold to mix with the milk flow. Once the flow of syrup ends, the poppet valve closes. Milk continues to flow into the syrup manifold, once the syrup poppet valve closes to rinse the syrup manifold of residual syrup and then steam is flushed through the syrup manifold, to clear the manifold of residual milk.

At the end of a syrup-based drink pour, a small amount of steam is flushed through the syrup manifold.

Flavor Tubes

There is a dedicated flavor tube for each flavor. Each flavor tube is color-coded for ease of use and to prevent cross-contamination of flavors.

Each flavor tube begins at the flavor box, goes through the peristaltic pump assembly, and then to the syrup manifold. To reach the syrup manifold, the flavor tubes are routed through the back of the machine. The color coding of the flavor tubes is listed below.

| Red | White | Yellow | Black | Blue | Green |
|------|---------|---------|-----------|--------------------|----------|
| Chai | Vanilla | Caramel | Chocolate | Sugar-Free Vanilla | Hazelnut |

Flavor Storage Area

Boxes of syrup can be laid flat on the floor of the flavor storage area and they can be stacked one atop another. Boxes of chocolate sauce are placed on a chocolate heater assembly, and chocolate sauce boxes must be placed side-by-side.

When placing a flavor box in the flavor storage area, verify the color on the box matches the color on the corresponding color-coded tube.

Chocolate Sauce

Chocolate sauce must be pre-warmed before use. The minimum temperature must be 85°F (29.4°C) for chocolate sauce flow properly. If the chocolate sauce is not flowing, and the flavor box is not empty, check the chocolate heater assembly. The chocolate sauce must be kept at the proper temperature.

At the time of installation, if the chocolate sauce is cold, it must be brought to a temperature of 85°F (29.4°C) or warmer. If the chocolate sauce is not warm enough to flow through the flavor tubes, you will not be able to finish installation of the Xpress.

It is strongly recommended to always have to an extra box of chocolate sauce on the chocolate heater assembly, to ensure an uninterrupted supply of chocolate sauce is available.

Chocolate Heater Assembly

The chocolate heater assembly provides heat to the chocolate sauce box(es), to maintain a minimum temperature of 85°F (29.4°C) and to ensure a consistent rate of flow.

Connecting Flavor Tubing

1. Place the flavor box on the counter, with the connector facing up.
2. Open box at the "OPEN HERE" location, and extract the connector that the nozzle will be inserted into.
3. Remove protective foil from the connector.
4. Using a wet cloth, moisten the o-ring on the nozzle.
5. Insert the nozzle into the connector, until it clicks.
6. Purge flavor tube (to remove all air from the flavor bag and the flavor tube).

After verifying there are no air bubbles in the flavor tube, put the flavor box in the flavor storage area; verify the tubing is not pinched, kinked, or twisted.

Changing the Flavor Pour Rate

1. Place a measuring cup under the product nozzle.
2. Press the service switch into the **CLEAN** position.
3. Press the **PROGRAM** button three times.
4. Navigate to **FLAVOR TIMINGS**.
5. Press the **PROGRAM** button once, and then scroll to the desired flavor.
6. Press the upper right arrow to increase the amount of flavor or press the lower right arrow to decrease the amount of flavor.
7. Press the **PROGRAM** button once to exit the **FLAVOR TIMINGS** category.
8. Press the **CANCEL** button to exit the menu system.
9. Pour a drink with the desired flavor, to ensure amount of flavor is to taste.

| Software Sub-Category | Color Code | Corresponding Flavor |
|-----------------------|------------|----------------------|
| Small Flavor 1 | Black | Chocolate |
| Large Flavor 1 | | |
| Small Flavor 2 | Yellow | Caramel |
| Large Flavor 2 | | |
| Small Flavor 3 | White | Vanilla |
| Large Flavor 3 | | |
| Small Flavor 4 | Red | Chai |
| Large Flavor 4 | | |
| Small Flavor 5 | Green | Hazelnut |
| Large Flavor 5 | | |
| Small Flavor 6 | Blue | Sugar-Free Vanilla |
| Large Flavor 6 | | |

Chocolate sauce flows at the rate of 0.28oz (8.31mL) per second.

Flavor syrups flow at the rate of 0.31oz (9.2mL) per second.

EXAMPLE: If the chocolate sauce timing is set for seven seconds, then 1.96oz (58.17mL) of sauce should be in the cup.

EXAMPLE: If the vanilla timing is set for ten seconds, 3.1oz (92mL) of flavor should be in the cup.

When the amount of flavor, or an additional flavor, is increased or decreased in a drink, the milk pour time must be adjusted to accommodate the change. The adjustment to the milk pour time is controlled in the **FLAVOR TIMINGS** sub-category by the values **SMALL 1-FLAVOR ADJ**, **SMALL 2-FLAVOR ADJ**, **LARGE 1-FLAVOR**, **LARGE 2-FLAVOR ADJ**.

Milk volume is reduced by 5 percent per shot of flavor. If one shot of flavor is added to a drink, the milk volume is adjusted to 95 percent of its normal setting, and 90 percent for two shots of flavor. When the amount of flavor is altered, adjust the milk volume in 1 percent increments.

NOTE: It is not possible to change the milk pour rate for a single flavor; making a change to one setting will affect the pour times for all drinks.

| Flavor in Ounces | Flavor Pour Time in Seconds | | | | | | | | | | |
|------------------|-----------------------------|------|------|------|------|------|------|------|------|------|------|
| | | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| | Chocolate Sauce | 0.28 | 0.56 | 0.84 | 1.12 | 1.4 | 1.68 | 1.96 | 2.24 | 2.52 | 2.80 |
| | All other flavors | 0.31 | 0.62 | 0.93 | 1.24 | 1.55 | 1.86 | 2.17 | 2.48 | 2.79 | 3.10 |

| Flavor in Milliliters | Flavor Pour Time in Seconds | | | | | | | | | | |
|-----------------------|-----------------------------|------|-------|-------|-------|-------|-------|-------|-------|-------|------|
| | | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| | Chocolate Sauce | 8.31 | 16.62 | 24.93 | 33.24 | 41.55 | 49.86 | 58.17 | 66.48 | 74.79 | 83.1 |
| | All other flavors | 9.2 | 18.4 | 27.6 | 36.8 | 46.0 | 55.2 | 64.4 | 73.6 | 82.8 | 92.0 |

Verifying Proper Syrup Flow

It is important to verify proper syrup flow. Properly flowing syrup will flow in an uninterrupted stream.

Possible causes of bad pours include:

- Flavor box exposed to temperature below 32°F (0°C)
- Flavor box exposed to temperature above 110°F (43°C)
- Loose nozzle and/or connector
- Damaged connector o-ring

Symptoms of flavor over-exposure to heat or cold:

- Flavor stream has cloudy appearance
- Flavor stream has appearance of crystallization
- Flavor dispensed has a weak flavor
- Burst peristaltic pump tubing

NOTE: There should never be any particles floating in the product. Particles generally indicate that the flavor tube is contaminated and that the flavor tube needs to be cleaned and primed.

NOTE: Syrups must not be used if they are, or have been, frozen. If the syrups have been at a temperature lower than 32°F (0°C), then they are unusable. Do NOT use any syrup that has been frozen.

Once the desired flavor button is pressed, the flavor will be dispensed for the time indicated.

Changing Flavor Boxes

Before replacing a flavor box, verify the bag is empty.

For chocolate syrup boxes, the bag inside the box may crease or partially collapse and block the flow of flavor. It may only be necessary to manipulate the bag for chocolate sauce to flow properly. For instructions on how to do this, please call Concordia Beverage Systems for assistance at 1-800-778-0990.

1. Place a cleaning rag under the nozzle, to catch any flavor drips.
2. Hold connector in place with one hand.
3. Grasp nozzle with other hand.
4. Using thumb, push on left side of nozzle handle to release the nozzle and then pull from connector.

NOTE: When removing an empty flavor box, DO NOT pull by grabbing the tubing or connector on a flavor box.

Once the nozzle is removed from the connector, remove the empty box from the flavor storage area. Do NOT place the nozzle on the floor.

NOTE: It is normal that there may still be a small amount of syrup or sauce in a bag when the bag is empty. A small amount of syrup or sauce may also drip when the nozzle is removed from the bag.

To replace syrup/sauce box

1. Open box at the "OPEN HERE" location, and extract the connector.
2. Remove protective seal from the connector.
3. Clean the nozzle and o-ring thoroughly with a wet cloth, to remove any debris, provide lubrication, and remove syrup or sauce residue.

NOTE: Re-inserting a dry o-ring may result in leaks.

4. Hold connector firmly with hand.
5. Insert correct color-coded nozzle into connector firmly, until the nozzle handle clicks into place.

WARNING: Do not try to insert the nozzle without holding the connector, or the connector may be pushed into the box.

Peristaltic Pumps

Operating Voltage: 24Vdc
282rpm

A peristaltic pump has a roller assembly attached to a rotating armature that presses tubing against a rigid semicircular wall. The tube is filled with product and as the tube is compressed, the product is pushed through the tube, towards the syrup valve.

The amount of time the pump operates is adjustable in the **FLAVOR TIMINGS** sub-category of the software menu.

When replacing the pump or tubing, be certain to correctly route the tubing, to ensure proper flow. Also, verify tubing is not twisted or binding.

There is a dedicated peristaltic pump for each flavor, for a total of six pumps.

Syrup Manifold

The tubing from the peristaltic pumps connects to the syrup manifold, to deliver flavor syrup or chocolate sauce. The syrup manifold is located above the milk bowl and the drink output nozzles.

Poppet valves control the flavor flow and each flavor has a dedicated poppet valve. The pressure created when a flavor is chosen and dispensed opens the valve. The poppet valve is not electronically controlled. After the flavor is pumped into the syrup manifold, the pressure to the poppet valve equalizes and the poppet valve naturally closes.

When connecting the tubing to the manifold, ensure the color on the flavor tube matches the color for the connection point on the syrup manifold. The color-coding scheme is consistent throughout the flavor delivery system and must be followed to prevent cross-contamination of syrup tubes.

Chocolate Rinse Purge Valve

After a drink with chocolate sauce is poured, water is introduced to rinse the chocolate poppet valve, to prevent chocolate sauce build up on the poppet o-ring, which can cause it to leak.

Milk Bowl

Both the Xpress and Xpress 6 machines have a milk bowl.

The milk bowl is a mixing chamber where steamed milk and flavors are fully mixed before flowing through the product delivery nozzle and into the customer's cup.

Bottom View of Manifold

Removing the Syrup Manifold

Prior to removing and replacing a syrup manifold, perform a flavor system clean. It may be necessary to run more than one flavor system clean to ensure all tubes are clean and clear. See page 9-10 for instructions for cleaning the flavor system.

1. Remove the three screws attaching the syrup manifold to the milk bowl.
2. Disconnect the adapter.
3. Disconnect the elbow.
4. Cut all flavor tubes just above the barbed fitting.

NOTE: Before cutting flavor tubes, note the placement of the colored tubes in the manifold, especially for the chocolate sauce tube. Doing this will ensure consistent placement of flavor tubing.

At this point, the syrup manifold can be removed.

Replacing the Syrup Manifold

1. Re-install all flavor tubing.

NOTE: Ensure the end of the tube goes completely over the barbed fitting.

2. Attach a Ty-Wrap to each tube, between the barbed end and the top of the hex fitting.
3. Re-install the elbow fitting.
4. Re-install the adapter.
5. Place the new syrup manifold assembly on top of the milk bowl.

NOTE: Ensure the o-ring between the milk bowl and syrup manifold is in the correct position. The o-ring should fit into the groove smoothly and should not be pinched.

6. Re-align the syrup manifold atop the milk bowl.
7. Re-attach the syrup manifold to the milk bowl, using the three screws.
8. Prime the syrup system. See the *Priming the Flavor Delivery System* topic on page 9-12 for instructions.

Cleaning the Flavor Delivery System

The flavor system must be cleaned under the following circumstances:

- Cross-contamination of a flavor tube
- During a Preventive Maintenance call
- Replacing the syrup manifold

The Flavor Delivery System Cleaning Process

Use rubber gloves, protective eye wear, and clothing protection while performing this process.

1. Press the service switch into the **CLEAN** position.
2. Place an open half-gallon container under the product outlet and press the **HOT WATER** button on the right door to fill the container with hot water. If the machine has a steam wand, navigate to **TEST ROUTINES > HOT WATER VALVE** and press the upper right arrow to fill the container with hot water.
3. Mix two packets of **CLEANER #1** into the container of hot water. Stir until cleaner is dissolved.
4. Disconnect the flavor tube nozzles from the flavor boxes and place them in the **CLEANER #1** cleaning solution.

NOTE: To maintain a clean workspace, place a clean cloth under the flavor box connectors to catch any drips.

5. Enter the software menu and navigate to **MISCELLANEOUS > RUN SYRUP CLEAN**. Press the upper right arrow button to start the syrup clean process.

NOTE: Ensure all flavor tube nozzles remain completely submerged during the cleaning cycle.

6. Once the cycle completes, place the flavor tube nozzles on a clean towel, and then empty and rinse the container.
7. Refill the container with hot water as in step 2 above.

8. Mix two packets of **CLEANER #2** into the container of hot water. Stir until cleaner is dissolved.
9. Place the flavor tube nozzles into the **CLEANER #2** cleaning solution.
10. Run the **RUN SYRUP CLEAN** process.
NOTE: Ensure all flavor tube nozzles remain completely submerged during the cleaning cycle.
11. Once the cycle completes, place the flavor tube nozzles on a clean towel, and then empty and rinse the container.
12. Refill the container with hot water as in step 2 above.
13. Place the flavor tube nozzles into the container with the hot water.
14. Run the **RUN SYRUP CLEAN** process.
NOTE: Ensure all flavor tube nozzles remain completely submerged during the cleaning cycle.
15. Once the cycle completes, place the flavor tube nozzles on a clean towel, and then empty and rinse the container.
16. Run a milk clean cycle (see milk clean instructions).
17. Once the milk clean cycle is complete, wipe the product nozzle with a clean cloth soaked in a sanitizer approved by your State and Local Health Department regulations. Spraying the solution onto and around the nozzle and then wiping it down with a soaked clean cloth is quite effective.
18. Reconnect the flavor tube nozzles to the appropriate bag-in-box flavors.
19. Prime the syrup system. See the *Priming the Flavor Delivery System* topic on page 9-12 for instructions.

Priming the Flavor Delivery System

The flavor system must be primed under the following circumstances:

- Initial setup of flavor system
- When a new flavor is introduced (e.g. caramel is replaced by almond)

NOTE: The affected flavor tube **MUST** be cleaned before the new flavor is introduced

- An air bubble needs to be purged from a tube
- When flavor tubing is replaced
- Replacing the syrup manifold

The Flavor Delivery System Priming Process (Automatic)

1. Press the service switch into the **CLEAN** position.
2. Navigate to **MISCELLANEOUS > RUN SYRUP CLEAN** and follow the screen prompts to begin the syrup clean cycle.

NOTE: Ensure nozzles are connected to appropriate flavor box connectors.

NOTE: To ensure tubes are properly primed, it may be necessary to run this procedure twice. Verify each syrup tube is primed by observing a smooth flow of syrup at the dispensing nozzle.

NOTE: If flavor is not present at this point, run the **RUN SYRUP CLEAN** cycle again.

To ensure all the syrup tubes are primed and functioning properly, pour one drink per flavor.

Once all these steps are completed, stow all implements used, clean up the work area, and place the service switch in the **VEND** position.

The Flavor Delivery System Priming Process (Manually)

To manually prime an individual syrup tube, navigate to **TEST ROUTINES > SYRUP** and press the appropriate syrup button on the touch pad menu. Press and hold the flavor button until the flavor comes out continuously and smoothly.

If you are purging a flavor tube because of an air bubble, continually press the appropriate flavor button until the air bubble passes. You will know when this happens because the flavor will splutter, and then run continuously and smoothly.

Section 10 :: Vending

1. Vending Overview
2. Replacing a Card Reader
3. Installing a Vending Unit
4. Removing a Vending Unit
5. Troubleshooting

CONCORDIA

BEVERAGE SYSTEMS

Vending Overview

An optional vending feature allows for customers to charge for drinks. Only cards (i.e. debit, credit, school swipe cards) can be used with this system.

Vending units are mounted on the refrigeration unit door, on the outside of the machine.

Vending Backpack

The vending backpack is located on the back of the machine and contains the following vending components:

- Modem
- Jamex vending controller
- Power supply
- Cable

An antenna is placed on the rear top edge of the machine.

Replacing a Card Reader

1. Remove the right front door assembly of the machine.
2. Remove the two upper and four lower screws on the inside panel of the door assembly.
3. Remove the inside panel of the door assembly.
4. Remove the door handle from the front of the door.
5. Remove the screws attaching the card reader to the door handle.
6. Remove the card reader from the door handle.
7. Attach a new card reader to the door handle with the screws previously removed.
8. Re-attach the door handle to the front of the door assembly.
9. Re-attach the inside panel of the door assembly, using the screws previously removed.
10. Re-attach the right front door assembly on the machine.

Installing a Vending Unit

Installation of vending units is done by Concordia, prior to a customer receiving the machine. Existing units cannot be upgraded in the field by a technician. If a customer wishes to add vending to an existing machine, please contact Concordia Beverage Systems for assistance at 1-800-778-0990.

Removing a Vending Unit

1. Follow steps 1 through 6 of the *Replacing a Card Reader* instructions on page 10-2.
2. Replace the door assembly handle with a non-vending handle.
3. Remove the vending backpack
 - a. Remove the back panel of the machine.
 - b. Remove the left panel of the machine.
 - c. Disconnect the harness wiring connecting the backpack to the left side bracket
4. Re-attach the left panel of the machine.
5. Re-attach the back panel of the machine.
6. Re-attach the right door assembly.
7. Navigate to **SPECIAL FEATURES > VENDING** and ensure the vending option is disabled.

Troubleshooting

If a vending unit is not functioning as expected, first try rebooting the power to the machine.

If a vending unit is installed but does not appear to be working, navigate to **SPECIAL FEATURES > VENDING** and ensure the vending option is enabled.

For further assistance troubleshooting issues with the vending unit, see the vending system troubleshooting trees in *Section 15: Troubleshooting*.

Section 11 :: Cleaning and Maintenance

1. Daily Maintenance
2. Cleaning Timers
3. Preventive Maintenance

CONCORDIA

BEVERAGE SYSTEMS

Daily Maintenance

In order to avoid mechanical failure and maintain cleanliness, the Xpress espresso machine must be cleaned and maintained on a daily basis. If the machine is not cleaned as indicated below, the machine will be disabled and the customer will not be able to pour drinks. If the machine is disabled, a complete cleaning cycle must be performed in order to resume operation.

Daily Maintenance includes:

1. Clean the milk system.
2. Clean the brew group.
3. Empty the grounds bin.
4. Clean the drain grate and drain tray.
5. Clean the exterior surfaces.
6. Clean the interior of the refrigeration unit.
7. Refill beans, milk, and flavors.
8. Clean the product delivery nozzle.

Monthly Maintenance includes:

1. Check the air filter; replace if necessary.
2. Clean the bean hoppers.
3. Replace the upper piston o-ring, and then reset the o-ring counter.

To perform cleaning procedures, the service switch must be in the **CLEAN** position. For more information about the service switch, please see page 4-3.

For detailed cleaning instructions for the espresso machine, please refer to the cleaning cards.

Concordia Cleaning Products

To maintain the machine warranty, Concordia cleaning products must be used.

The cleaning kit includes 130 each of the following items:

- Milk System Cleaner #1 Packets
- Milk System Cleaner #2 Packets
- Brew Group Cleaning Tablets

Cleaning products can discolor clothing and countertops, use with care. Wear eye protection and gloves while using the product and wash hands after handling. Read the complete cautionary statement on packaging.

Cleaning Timers

The milk system and brew group must be cleaned every 24 hours, or after every 300 drinks, whichever comes first. If these cleaning procedures are not completed within two hours of notification, the machine will be disabled and will stop dispensing drinks until cleaning is performed.

All timers start after the first drink is poured following a cleaning. For example, if the machine is cleaned on Friday night, and it is idle Saturday and Sunday, the timers are not started until the first drink is poured Monday morning.

Preventive Maintenance

A Preventive Maintenance (PM) call must be performed periodically, in order to service critical equipment functions and to minimize potential future failure and reduce down time. Every 30,000 drinks, the message **REQUEST PM** will be displayed on the message screen.

A PM kit (PN 5000-038), containing all the required replacement parts and procedures, is available from Concordia Beverage Systems.

Navigate to **MISCELLANEOUS > RESET PM** to reset the PM counter.

Section 12 :: Concordia Procedures

1. Service Call Process
2. Complete Call Protocol
3. Service Call Checklist
4. Parts Return Policy
5. Parts Replenishment Form

CONCORDIA

BEVERAGE SYSTEMS

TECHNICAL SUPPORT

Service Call Process

The following steps should be taken on every service call dispatched by Concordia.

Arrival to Site

- Park in a space that will not impede customers from visiting the business you are servicing.
- Find the primary contact listed on your call. If possible, contact the caller identified on your service call. Ensure you close out your service call with the same contact.

Machine Repair

- Determine the repair necessary and complete service on the machine.
- Do not spread tools and parts around in the business.
- Respect the customer's business while you repair their machine.
- Record current quantity on hand of Concordia cleaning products; recommend ordering or signing up for auto-shipment of cleaning products if account is low on supplies.
- Repair identified problem, if you have any questions about repairing the machine, call Concordia Beverage Systems for assistance at 1-800-778-0990.
- Follow Concordia's Complete Call Protocol, ensuring all aspects of the machine are functioning.

Hold for Parts Procedures

- When the machine cannot be repaired due to part needs, every effort should be made to leave the machine functioning.
- Verify parts availability and communicate estimated return date/time to the customer.
- If a machine is not operational, ensure parts are ordered Next Day Air.

Departing from Site

- Review with customer the service provided and items repaired.
- Review future troubleshooting procedures, any possible preventative maintenance the customer may perform, and review the daily cleaning procedures.
- Obtain customer signature on work order.

Required Immediately for Call Closeout

- Complete the **SERVICE CALL CHECKLIST** and fax or email it to Concordia Beverage Systems.
- Closing a service call requires the following information: Time Started, Time Completed, and Service Codes for the repair.

Complete Call Protocol

On each service call, Concordia requires the entire machine be inspected to ensure continued operation.

Machine Appearance

- Interior/exterior clean

Milk System

- Cleanliness: **ZERO INTERNAL BUILD-UP**
- Calibration: Proper temperatures and levels

Brew Group

- Lower piston leakage: evidence would be indicated by espresso on the gearbox
- Piston travel times: Using **TEST ROUTINES**, from lower to upper crash should require no more than 15 seconds
- Condition of lower piston microscreen: No tears or holes
- Free-play of right drive: No more than 1/8" / .38cm side to side

Water Tank

- Operating temp: $\pm 1^{\circ}\text{F}$ (.5°C) of temperature setting
NOTE: The temperature setting should be the highest setting for either the latte or cappuccino setting, *plus* the setting of the flavor offset temperature. For example, if the latte setting is 242°F (117°C) and the cappuccino setting is 243°F (117°C), and the flavor offset temperature is 3°F (-16°C), then the steam temperature would be 246°F (119°C).
- Check for leakage

Water Pump

- Set to 135-140psi

Steam Tank

- Operating temperature: $\pm 2^{\circ}\text{F}$ (1°C) of temperature setting
- Leakage: none
- During latte pour, pressure should not drop below 8psi.

Refrigeration Unit

- Operating temperature: No higher than 39.9°F (4.4°C)
- AMP Draw: 11-13amps
- Condition of filter
- Cleanliness

Espresso Extraction

- Double extraction time of 18-23 seconds
- Single extraction time of 15-18 seconds
- Triple extraction time of 23-30 seconds
- Pour temperature of 175°F (79°C) \pm 10°F (6°C)

Milk Pour

- Latte temperature: 160°F (71°C) \pm 5°F (3°C)
- Cappuccino temperature: 155°F (68°C) \pm 5°F (3°C)

Service Call Checklist

This checklist must be completed and submitted with each service invoice.

| CUSTOMER INFORMATION | | | |
|---|----------------|---|-------------------|
| Customer Name: | City: | Call Number: | Service Date: |
| Model: | Serial Number: | Drink Count: | Last Clean Cycle: |

Parts Return Policy

Non-Consignment Agents

To qualify for reimbursement on warranty and/or contract parts, the servicing agency must maintain a basic stock of parts as listed on the recommended parts list. The servicing agency must place an order to replenish a part within seven (7) days of a part being used. If a servicing agency has to order and/or return a part not on the recommended parts list, Concordia will pay for shipping the part back to Concordia.

The warranty for new parts from Concordia is for 90 days. This applies to both new machines and replacement parts. The warranty for a new machine is one year.

Concordia has determined that some items are consumable and do not need to be returned.

Returned parts must be shipped UPS Ground. The shipping fees are reimbursed. To qualify for reimbursement, parts must be returned within 30 days of removal.

Return requests for unused new parts are subject to management review. Authorization is given for current parts; obsolete parts cannot be returned.

To qualify for reimbursement for parts returned under warranty, the servicing entity must request a Return Material Authorization (RMA) from the Concordia Beverage Systems Parts Coordinator. The part(s) returned must have a completed Return Material Tag (RMT) attached with the RMA number written on the RMT.

Call Concordia Beverage Systems at 1-800-778-0990 for additional returned authorization supplies.

Consignment Agents

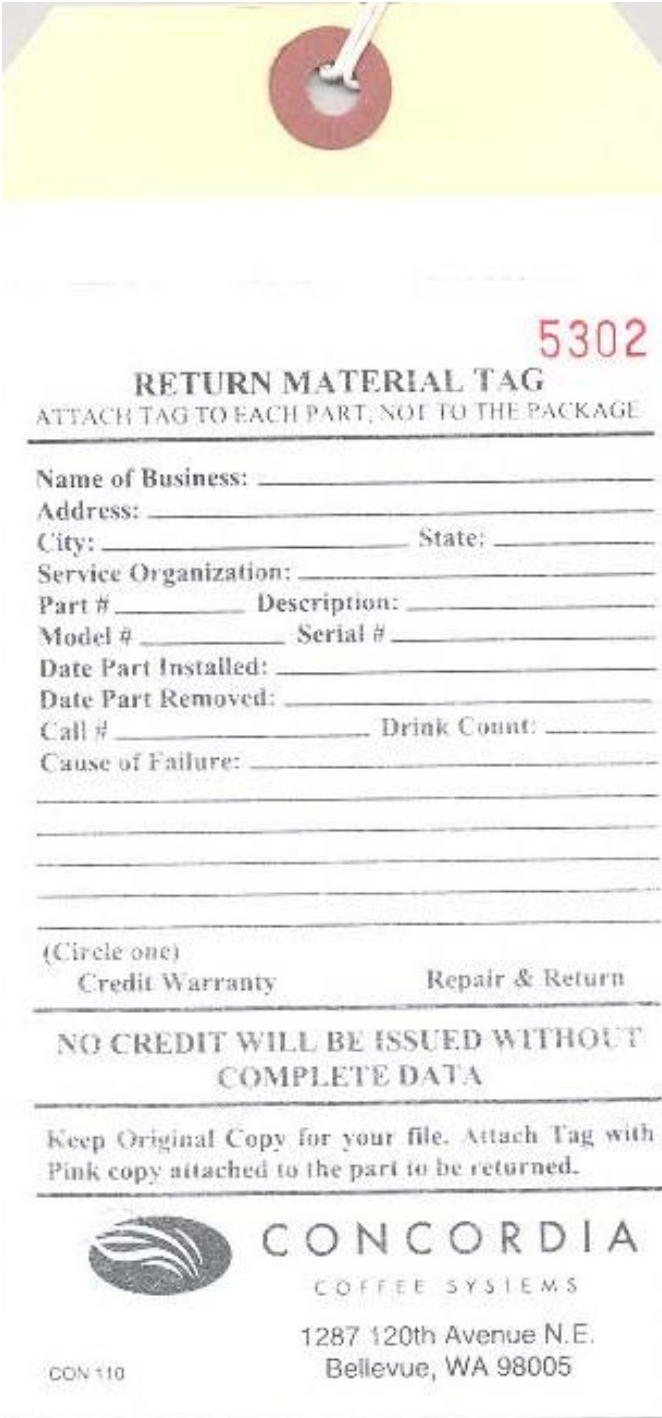

Part returns for consignment agents should be performed as detailed in their service agreement.

Any used parts returned must have a completed Return Material Tag attached.

Return Material Tag

Each part must have a Return Material Tag filled out properly. If the tag is not complete, parts will not be replaced or credited.

A 15% handling fee will be charged for any tags or forms not filled out completely on non-consignment returns.

Parts Replenishment Form

Concordia Beverage Systems provides a parts replenishment form for agents to submit. This form should be filled out weekly and submitted to Concordia Beverage Systems, detailing each part used during service calls over the previous week.

Submitting this form will generate a sales order so that items that were used are replaced within one week.

It is the service agent's responsibility to use and regularly submit the parts replenishment form so that proper inventory levels are maintained.

Section 13 :: Customer Service and Training

1. Training the Customer
2. Concordia Beverage System's Value Added Service
3. G.U.E.S.T.

CONCORDIA

BEVERAGE SYSTEMS

Training the Customer

Concordia requires complete customer training at the time of installation. Cleaning instructions must be reviewed during each service call.

Customer Training Includes:

1. Using the *User Guide*.
2. Starting and resetting the machine.
3. Filling machine with beans and milk.
4. Pouring drinks and canceling drinks.
5. Restocking and changing flavor boxes.
6. Complete daily cleaning using the cleaning cards.
7. Accessing the machine serial number.
8. Accessing the software menu.
9. Troubleshooting tips.
10. How to contact Concordia Beverage Systems.

User Guide

Use and refer to the *User Guide* and cleaning cards when training the customer. The customer's understanding of all information contained in these materials is essential to their success in maintaining the machine.

Starting and Resetting the Machine

Use the User Guide to show the customer how to start and reset the machine.

Filling Machine with Beans and Milk

Demonstrate and have customer fill the bean hoppers with espresso beans. Explain the front hopper is typically filled with caffeinated beans and the rear hopper with decaffeinated beans. Demonstrate how to use the hopper stopper.

Demonstrate and have the customer place milk in the refrigeration unit. Explain the importance of ensuring there are no kinks in the milk pick-up tubes. Demonstrate the correct placement of the milk weight trays in the refrigeration unit.

Pouring Drinks and Cancelling Drinks

Demonstrate and have customer make each beverage: espresso, double espresso, latte, double latte, and cappuccino. Also explain how to cancel a drink selection.

Restocking and Changing Flavor Boxes

Demonstrate checking the level of flavor in a flavor box and have the customer change and connect a flavor box.

Cleaning

Explain all cleaning products and cleaning procedures. Use the cleaning cards when training customer on the cleaning and maintenance of the machine.

Demonstrate and have customer:

1. Complete daily cleaning procedures
2. Complete monthly cleaning procedures
3. Clean the refrigeration unit
4. Clean the drain grate and tray
5. Wipe down the exterior of machine
6. Empty and clean the grounds bin

Ordering Cleaning Supplies

The customer is required to purchase Concordia cleaning supplies and clean their machine daily to maintain their warranty or service agreement. Failure to order adequate cleaning product and to clean the machine can void the warranty.

To order additional cleaning supplies or flavors, the customer needs to call or email Concordia Customer Service. To order by email, the customer should write to:

Customer_service@concordiacoffee.com

Order forms are available by writing to the email address above.

Additionally, Concordia offers auto-shipment of cleaning supplies. Upon the customer's request, cleaning kits will be automatically shipped to their location every 4-6 months, depending on customer usage.

Serial Number

Show customer the location of serial number on machine. Advise the customer that they must provide the serial number when calling Concordia Customer Service.

Accessing Software Menu

Demonstrate and have customer access the software menu. Review how to view daily and grand total drink statistics.

Troubleshooting Tips

Demonstrate simple troubleshooting tips, including:

- Correct placement of the milk weight tray(s)
- Correct placement of the milk pick-up tubes
- Checking and cleaning the air filter
- Correct placement of flavor boxes

Contacting Concordia for Assistance

In the *User Guide*, review the location of the Concordia Beverage Systems customer service number (1-800-778-0990) and advise the customer to call Concordia with any questions about their new machine.

Concordia Beverage Systems' Value-Added Service

VALUE-ADDED SERVICE is the foundation of Concordia's success. The growth of any service organization depends upon providing quality service and building solid relationships with customers. Service technicians are the key to building and maintaining customer relationships. Technicians are the ambassadors of the companies they represent.

As a Concordia technician, you will see Concordia customers to perform routine maintenance an average of 3-5 times per year; *more than any other representative of Concordia.*

This is why Customer Service is the foundation of all that we do on a day-to-day basis. While Concordia manufactures Concordia Espresso machines, our ability to grow depends upon our relationship with our customers.

Value-Added Service

Equipment repair is the basic responsibility of a technician. The technician's responsibility is to master the ability to troubleshoot and solve difficult problems. This, however, only addresses one aspect of the repair. The most important job of a technician is to understand the customer's perception of the problem. Only when you address what the customer perceives as the problem have you provided customer Service.

Forming a strong relationship depends on your ability to provide effective customer service. Most customers are indebted by the service you provide. After all, they have customers too, and it is a difficult conversation when they have to tell their customers that the machine is broken, not to mention their lost revenue. To further illustrate the level of indebtedness, consider how many times you have been offered something in return for the service you provided (e.g. "Can I get you some lunch?").

Each time you contact a customer, you have potential to build equity. Equity is like a bank account. When you have a positive experience with a customer, you make a deposit. Customers remember you and your ability to provide what is right for them. Each opportunity to service a customer must be capitalized in the most constructive means possible.

As you provide solid customer service, establish a good relationship and build equity, you will find that your customers begin to *trust* you. Trust is important when making decisions that you know are in the customer's best interest. Would you recommend a piece of equipment to a customer who you know had no faith in your abilities? Maybe, but you probably would not be successful.

CUSTOMER SERVICE, RELATIONSHIPS, EQUITY and TRUST are the foundations the true goal: A **VALUE-ADDED SERVICE**. Partnerships are give and take. You give great service; you take the benefit of being able to suggest new ideas. The customer gives your ideas credence; they take the benefit of your customer service. When added all together, the customer wins because their equipment is working and making money. You win because you can recommend more reliable equipment and make your job a more enjoyable. Your company wins because they reap the benefits of a solid reputation and potential new sales.

G.U.E.S.T.

-  **G Greet the Customer**
-  **U Understand your Customer**
-  **E Empathize with your Customer**
-  **S Solve the Problem**
-  **T Train the Customer**

Greet the Customer

How you greet the customer sets the tone the entire service call. The remainder of the communication, for both today's service call and future service calls, will be affected by this initial meeting with the customer.

Providing a professional image is the first step in building a solid relationship with the customer. Image includes professional attire and greeting the customer in a professional manner.

When greeting the customer, make sure you:

- Provide a well-groomed appearance – preferably wearing a uniform
- Introduce yourself: Include your name, the company you represent and the reason for your visit
- Offer a business card if you have one
- Ask to speak to the person who requested service

Greeting

"Hi, I'm Alex with Awesome Service XYZ Company, is Bob here? He reported a problem with your Concordia espresso machine."

(going to get caller)

"Hi Bob, (Hand out business card if you have one) I'm Alex with Awesome Service XYZ Company. I'm here to repair the problem with your espresso machine, what can you tell me about it?"

Greeting your customer is the first step in creating open dialogue between you and the customer.

The last phrase in the above example is the most important phrase you can ever remember. "What can you tell me?" "How can I help you?" Through their answer to this phrase you begin to understand your customer's concern.

Understand your Customer

Asking open-ended questions is the first step in understanding the customer. Open-ended questions increase communication and your understanding of the customer's needs.

Is the machine working? This is not an open-ended question. The customer will typically answer with Yes or No. Once the answer is provided, dialogue will stop.

What is happening with your machine? This question will provide an open door for communication and understanding of the customer's concerns.

Additional open-ended questions you may find helpful:

What can you tell me about your machine?
How can I help you?
What is the machine doing?
When did it start?
What have you tried?
How do you clean your machine?

LISTEN

To truly understand your customer, you must listen to what they have to say. A customer may call in for one issue, but have several concerns that need to be addressed.

ASK Again

Ask clarifying questions to ensure that you understand. When? Where? How often? Asking additional questions will accomplish three very important things:

1. Provide information related to the problem area in the machine
2. Verify what you may have already expected
3. Provide you an invaluable tool that you can use to verify the repair back to the customer

Use the information the customer provides as clues to a puzzle. Piece together every event until you have a clear picture of what has happened, when it happened, and how it happened. These factors will help lead you to a path of discovery and machine repair.

REPEAT BACK

One of the best ways to ensure you understand your customer's concern is to repeat back what you have been told.

“So, Sam, if I understand you correctly, every time you pour a latte the cup overflows, but the cappuccinos pour fine?”

You will find that simply seeking to understand your customer is a powerful relationship-building tool. Not only will you more readily understand what is happening with their machine, but also you will begin to **empathize** with their experience.

Through showing care and concern you can more easily gather information.

Empathize with Your Customer

Empathy is simply the act of identifying with the emotional experience of another person. When speaking with your customer, addressing their feelings is important, especially when those feelings are of frustration, anger or exasperation.

The quickest way to defuse the frustrated or angry ranting of another person is to simply acknowledge and identify with them.

Here are two key phrases that will help you empathize with your customer:

I *understand* how you feel. I would feel the same way under those circumstances.

I *appreciate* your situation. I would not like that to happen to me. Let me see what I can do to resolve this for you.

Notice the key in both of the phrases: *address emotion*. As a result of these two simple phrases, the customer will recognize that he or she is being heard.

Through using words like *understand* and *appreciate* you let the customer know you have **heard** what they just said.

Next, you address your identification with the customer's emotional response to a given situation. You are letting them know, “I **feel** what you **feel**.”

Empathy helps build the relationship with your customer. It broadens the communication pipeline allowing you to understand their needs and get your message across. Now that you've got their attention, earn their trust and respect.

Solve the Problem

This is where you earn your stripes. First and foremost in solving the customer's problem is to repair the customer's machine. Once you have clearly identified the customer's concern and expectations, you can focus your energy on repairing the machine.

Solving the problem, however, goes beyond making the repair. You must communicate with the customer as well.

Review with the customer what you found, how you addressed their particular problem, and how the repair you made will help prevent the problem from happening in the future.

Train the Customer

Your job as a service technician is to fix today's problem and prevent problems from happening in the future. In a large number of cases, future mechanical problems can be prevented by properly educating the customer.

This will require you to fully understand the nature of machine use by the account. Ask questions that will help you piece together who is primarily responsible for machine care. This is the person you want to educate.

Discuss the nature of the mechanical failure, and ways to prevent the problem from happening in the future. Always emphasize the importance of daily cleaning and the reduction of service that can be expected as a result. Other important factors are:

- Airflow around the re-circulating fans
- Keeping the refrigeration compartment free of foreign objects
- Changing water filter/softener cartridges at regular intervals
- Simple lubrication points
- Daily cleaning requirements

Always end your conversation by thanking the customer for their business.

Section 14 :: Messages

1. Troubleshooting Display Messages

CONCORDIA
BEVERAGE SYSTEMS

Troubleshooting Display Messages

Warning messages appear on the machine display. Other operational messages exist, which do not require action. If you see a message which is not included on this list and need assistance, please call Concordia Beverage Systems at 1-800-778-0990.

| DISPLAY MESSAGE | PROBABLE CAUSE | CORRECTIVE ACTION NEEDED |
|---------------------------|---|--|
| CHECK CLOCK | Time or date is invalid. | Enter the correct time and/or date in the auto start menu. When correcting the error, go through the menu from back to front by using the lower left down arrow. |
| CHECK STATS | The nonvolatile memory has become corrupted. | Clear the drink statistics and check all user parameters |
| CHK SENSOR VOLTAGE | Warns of a failure of the 9Vdc and/or -3Vdc used for the transducer and milk level sensors. A short in <i>either</i> one of these circuits will display this warning AND disable the steam tank heating element. | Unplugging the shorted circuit will reset the warning. To do this, unplug each milk level sensor and the transducer independently to determine which will cause the warning to go away. Replace shorted sensor. See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| CHECK STEAM TANK | Steam tank fill valve failure. | Navigate to TEST ROUTINES > STEAM FILL VALVE and diagnose. Check coil. Check valve for foreign objects/mineral deposits. Worn plunger seal. See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| | Level probe failure. | Navigate to TEST ROUTINES > UPPER STEAM PROBE and TEST ROUTINES > LOWER STEAM PROBE and test sensor. |
| | Steam tank 10-minute fill timeout has been exceeded. | Verify water supply to steam tank. Verify steam tank drain valve is closed. |

| DISPLAY MESSAGE | PROBABLE CAUSE | CORRECTIVE ACTION NEEDED |
|-------------------------|---|---|
| CHK ANALOG BOARD | Missing supply voltages. | Verify transformer secondary output voltages. Replace DC supply board. Install/replace analog board. See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| | Missing or bad analog board. | |
| CHK WATER FLOW | No incoming water supply. | Check that incoming water supply valve is open. Check for a clogged water filter. See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| | Dirty lower piston. | Run the brew clean process. Repeat if required. |
| | Grind too fine. | Adjust grind coarser. |
| | Faulty flowmeter. | Verify flowmeter wiring is correct. Navigate to TEST ROUTINES > BREW WATER VALVE , and verify counter increments. Ensure flowmeter is not clogged. |
| | Pump pressure. | Verify calibration. |
| CHK WATER SUPPLY | No incoming water supply. | Check that incoming water supply valve is open. Check for clogged filter. See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| | Open circuit at level probe. | Navigate to TEST ROUTINES > WATER LEVEL and diagnose. |
| CLOCK FAIL | The Real Time Clock is missing or inoperative. | Replace the CPU board. Set the date and time. |
| EMPTY GRNDS BIN | Grounds bin is full. | Empty grounds bin. Bin must be removed for at least six seconds to reset message. |
| FRONT PANEL FAIL | Bad connection between CPU board and front panel. | Check cable from front panel to CPU board. |
| | Defective front panel (PCA). | Replace the front panel circuit board assembly. |

| DISPLAY MESSAGE | PROBABLE CAUSE | CORRECTIVE ACTION NEEDED |
|-------------------------|---|--|
| FRONT PANEL OPEN | Open interlock circuit at front panel or left door. | Close doors. Navigate to TEST ROUTINES > FRONT PANEL and check using alternate magnet. |
| GROUND'S BIN OUT | Open interlock circuit at bin switch. | Ensure the grounds bin is pushed in completely and not inserted backwards. |
| | Grounds bin is not present. | Navigate to TEST ROUTINES > GROUND'S BIN and check using alternate magnet. |
| INVALID STOP L | The left piston was not able to complete its specified motion. | Check left drive components. See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| INVALID STOP R | The right piston was not able to complete its specified motion. | Check right drive components. See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| L DRIVE TIMEOUT | Left piston took too long to complete a movement. | Check left drive components. See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| L SENSOR FAIL | Left piston reference sensor has failed or is out of position. | Check the left piston reference sensor for correct position and proper operation. See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| LOW BEANS-FRONT | The bean level in the front hopper has dropped below the IR sensor beam line. | Refill beans. Verify the IR sensor is not affected by ambient light. |
| LOW BEANS-REAR | The bean level in the rear hopper has dropped below the IR sensor beam line. | Refill beans. Verify the IR sensor is not affected by ambient light. |
| NO MILK-FRONT | Front milk count is 75 or lower. | Verify milk level. Verify milk weight tray is properly installed and calibrated. |

| DISPLAY MESSAGE | PROBABLE CAUSE | CORRECTIVE ACTION NEEDED |
|------------------------|---|--|
| NO MILK-REAR | Rear milk count is 75 or lower. | Verify milk level. Verify milk weight tray is properly installed and calibrated. |
| R DRIVE TIMEOUT | Right piston took too long to complete a movement. | Check right drive components. |
| R SENSOR FAIL | Right piston reference sensor has failed or is out of position. | Check the right piston reference sensor for correct position and proper operation. |
| REFR AMPS HI | Refrigeration unit current in excess of 14.5amps. | Verify DC supply voltage to refrigeration unit module. Verify refrigeration unit module operation. |
| REFR AMPS LO | Refrigeration unit current is below 10amp. | Verify DC supply voltage to refrigeration unit module. Verify refrigeration unit module operation. |
| REFR TEMP HI | Refrigeration unit door open. | Check door for proper seal. |
| | Refrigeration unit fan failure. | Replace fan. Verify fan is operating and unobstructed, replace if necessary. Verify ambient temperature is below 84°F (29°C). See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| | Air filter blocked. | Change filter. |
| | Short circuit on refrigeration temperature sensor. | Navigate to CHK TEMPERATURES > REFRIGERATOR and verify temperature. Shorted sensor = 67.3°F (20°C). |
| | Thermal chip failure. | Check DC board LEDs D17, D18, D19. Verify operation of thermal chip. |
| REFR TEMP LO | Open circuit on refrigeration unit temperature sensor. | Navigate to CHK TEMPERATURES > REFRIGERATOR and verify temperature. Open sensor = 0.8°F (-17°C). See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| REFR DOOR OPEN | Door to the refrigeration unit is open. | Close refrigeration unit door. Verify door seal is in good condition. |

| DISPLAY MESSAGE | PROBABLE CAUSE | CORRECTIVE ACTION NEEDED |
|--------------------------|--|---|
| EXT REFR TEMP HI | Ambient temperature outside refrigeration unit is above 85°F (29°C). | Check air filter for debris or build up. Lower ambient air temperature. |
| RTC BATT FAIL | The battery in the Real Time Clock has failed. | Replace the CPU board. Set the date and time. |
| SEQUENCE ERROR | Bad instruction in drink sequence. | Note under what conditions the error occurs (drink type, modifiers used). Call Concordia Beverage Systems for assistance. 1-800-778-0990 |
| STEAM HI LIMIT SW | Open thermal limit switch on the steam tank. | Verify proper operation of the steam heating circuit. Verify wiring to thermal limit switch. |
| WATER HI LIMIT SW | Open thermal limit switch on the water tank. | Verify proper operation of the water heating circuit. Verify wiring to the thermal limit switch. |
| STEAM TEMP HI | Pressure transducer failure. | Navigate to CHK TEMPERATURES > STEAM and verify temperature. Failed transducer = 278.6°F (137°C). See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| | Steam temperature setting higher than STEAM HI setting. | Call Concordia Beverage Systems for assistance. 1-800-778-0990 |
| | Relay failed in CLOSED mode. | Verify relay operation, replace if necessary. |

| DISPLAY MESSAGE | PROBABLE CAUSE | CORRECTIVE ACTION NEEDED |
|--|---|--|
| STEAM TEMP LO | Pressure transducer failure. | Navigate to CHK TEMPERATURES > STEAM and check temperature. Open transducer = 227.6°F (109°C). See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| | Thermal cutout switch failure. | Check for open switch. NOTE: Open switch may be caused if the steam tank temperature is higher than 250°F (121°C). |
| | Relay failed in OPEN mode. | Verify relay operation, replace if necessary. |
| WATER TEMP HI | Short circuit on water tank temperature sensor. | Navigate to CHK TEMPERATURES > BREW WATER and check temperature. Shorted sensor = 257°F (125°C). See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| | Brew water temperature setting is higher than BREW WATER HI set point. | Call Concordia Beverage Systems for assistance. 1-800-778-0990 |
| WASTE WATER FULL | Waste water container is full. | Empty waste water container. |
| WAIT WARMING UP constantly displayed | No or low water condition in steam tank. | Verify water supply is available. Verify steam tank drain valve is closed. Verify steam fill valve is operational. Verify steam tank inlet fitting is not clogged. |
| | Failed heater elements. | Check and replace if necessary. |
| | Failed solid-state relay or fuse. | Check and replace if necessary. |
| | Failed temperature limit switch. | Check and replace if necessary. |
| | Failed lower steam probe. | Verify probe assembly. |

| DISPLAY MESSAGE | PROBABLE CAUSE | CORRECTIVE ACTION NEEDED |
|---------------------------|--|--|
| WATER TEMP LO | Open circuit on water tank temperature sensor. | Navigate to CHK TEMPERATURES > BREW WATER and check temperature. Open sensor = 146°F (64°C). See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| | Relay or fuse failure. | Navigate to TEST ROUTINES > WATER HEATER and check. |
| | Thermal cutout switch failure. | Check for an open switch. NOTE: An open switch may be caused by if the water tank temperature is higher than 210°F (99°C). |
| | Heating element failure. | Check heating element. |
| | Brew water temperature is lower than BREW WATER LO setting. | Call Concordia Beverage Systems for assistance. 1-800-778-0990 |
| | Leaking pressure relief valve. | Check pressure relief valve. |
| SERVICE SWITCH | Service switch is in the CLEAN position for an extended period of time. | If cleaning or maintenance are not being performed, place service switch in the VEND position. |
| CHK EXPANSION BD | Voltages are incorrect. | Replace. |
| MISSING FRONT TRAY | Front milk weight tray in the refrigeration unit missing or not placed in unit properly. | Verify existence and placement of milk weight tray. |
| MISSING REAR TRAY | Rear milk weight tray in the refrigeration unit missing or not placed in unit properly. | Verify existence and placement of milk weight tray. |
| CHK STEAM PROBES | Invalid steam probe state (upper dry, lower wet). | Verify correct wiring placement. See <i>Section 15: Troubleshooting</i> for detailed instructions. |
| CHECK STEAM WAND | Steam temperature too high/low. Steam wand not physically connected to machine. | Verify steam temperature. Adjust as needed. Check wiring to steam wand. |
| MISSING ASW PCB | PCB not installed. | Install PCA expansion board (PN 2612-060). |

| DISPLAY MESSAGE | PROBABLE CAUSE | CORRECTIVE ACTION NEEDED |
|--------------------------|---|--|
| CHECK REFR MODULE | Refrigeration unit fan failure. | Replace fan. Verify fan is operating and unobstructed. Verify fan, and replace if necessary. Verify ambient temperature is below 82°F (27.7°C). |
| | Air filter blocked. | Change filter. |
| | Short circuit on refrigeration unit temperature sensor. | Navigate to CHK TEMPERATURES > REFRIGERATOR and verify the temperature. Shorted sensor = 67°F (20°C). |
| | Thermal chip failure. | Check DC board LEDs #D17, D18, D19. Verify operation of thermal chip. |
| | Refrigeration unit current below 10 amps <i>and</i> refrigeration unit temperature is above 41°F (5°C). | Verify DC voltage to module. Verify refrigeration unit module temperature physically. Check DC enclosure fan for proper operation. |
| INITIALIZE GROUP | Group initialization not done. | Verify brew group is functioning. <i>See Section 15: Troubleshooting</i> for detailed instructions. |
| PURGE IN PROCESS | Brew water tank not full; purging air. | Active when water tank level is below sensor. |
| REQUEST PM | Preventive maintenance due. | Perform preventive maintenance and reset message. |
| LOW MILK | Low milk level (single milk system). | Replenish milk supply. |
| LOW MILK-REAR | Low milk level in rear milk supply. | Replenish milk supply. |
| LOW MILK-FRONT | Low milk level in front milk supply. | Replenish milk supply. |
| REFILL LOWER MILK | Low milk level in lower milk supply. | Replenish milk supply. |
| MILK CLEAN DUE | Milk system needs to be cleaned. | Clean milk system. |

| DISPLAY MESSAGE | PROBABLE CAUSE | CORRECTIVE ACTION NEEDED |
|----------------------------|---|---|
| RUN MILK CLEAN! | Milk system clean required. | Clean milk system. |
| RUN BREW CLEAN! | Brew clean required. | Clean brew group. |
| BREW CLEAN DUE | Brew clean required. | Clean brew group. |
| OUT OF MILK | No milk available in the refrigeration unit. | Replenish milk supply. Check milk weight trays are functioning properly. |
| NO BEANS – FRONT | No espresso beans in front bean hopper. | Refill bean hopper. Move/redistribute beans in bean hopper. Remove hopper stopper. |
| NO BEANS – REAR | No espresso beans in rear bean hopper. | Refill bean hopper. Move/redistribute beans in bean hopper. Remove hopper stopper. |
| CHK FRONT CONTAINER | Front milk container in the refrigeration unit missing. | Replace milk container in refrigeration unit. Ensure correct placement of milk weight tray. Verify milk weight tray sensor functioning properly. |
| CHK REAR CONTAINER | Rear milk container in the refrigeration unit is missing. | Replace milk container in refrigeration unit. Ensure correct placement of milk weight tray. Verify milk weight tray sensor functioning properly. |
| DRINK COUNTING OFF | The drink counting featured is disabled. | Navigate to TOTAL DRINK COUNTS > DRINK COUNTING and enable the drink counting feature. |
| VENDING NOT READY | Jamex payment controller interface failure. | Refer to vending documentation. See <i>Section 15: Troubleshooting</i> for detailed instructions. Call Concordia Beverage Systems for assistance. 1-800-778-0990 |

BEVERAGE SYSTEMS

Troubleshooting Quick Reference Guide

Machine Failure

| SYMPTOM | PROBABLE CAUSE | CORRECTIVE ACTION NEEDED |
|--|--|---|
| Water pump doesn't run | Blown F1 or F2 fuse on the AC control PCA. | Replace blown fuse. NOTE: Use 5amp fuse only. |
| | Main AC relay not working. | Check for 24Vdc on the main power relay. |
| | Pump may have seized. | Check and replace if necessary. |
| Grinder doesn't run | Blown F3 or F4 fuse on the AC control PCA. | Replace blown fuse. NOTE: Use 5amp fuse only. |
| | Main AC relay not working. | Check for 24Vdc on the main power relay. |
| Blank display and faint flashing of D17-D19 on the DC power supply | Blown F15 fuse on the DC power supply | Replace blown fuse. NOTE: Use 5amp fuse only. |
| No display, fans are running and no green LEDs are lit on the DC power supply | Blown F16 fuse on the DC power supply. | Replace blown fuse. NOTE: Use 5amp fuse only. |
| The 12Vdc and 5Vdc LEDs are lit on the DC power supply. (CHK ANALOG BOARD may be displayed) | Blown F17 fuse on the DC power supply. | Replace blown fuse. NOTE: Use 5amp fuse only. |
| No fans running and both 24Vdc LEDs are lit on the DC power supply | Blown F18 fuse on the DC power supply. | Replace blown fuse. NOTE: Use 5amp fuse only. |
| Group motors do not run and both 38Vdc LEDs are lit on the DC power supply | Blown F19 fuse on the DC power supply. | Replace blown fuse. NOTE: Use 5amp fuse only. |

Coffee System

| SYMPTOM | PROBABLE CAUSE | CORRECTIVE ACTION NEEDED |
|--|---------------------------------------|---|
| No beans in grinder | Jammed hopper. | Stir beans in hopper. Clear out grinder affected. |
| | Hopper stopper is installed. | Remove hopper stopper. |
| No coffee flow | Brew valve failure. | Check for open coil. |
| | Clogged brew line or product nozzles. | Check for clogged product output path. |
| | Grounds too fine. | Check coffee powder dose. Verify grinder setting. |
| No coffee grounds exit from grinder spout | No beans in hopper. | Add beans. |
| | Blocked grinder spout. | Check for blockage. Check for jammed or damaged coffee powder flap. |
| | Hopper stopper is installed. | Remove hopper stopper. |
| Insufficient amount of coffee grounds in brew chamber | Hopper stopper is installed. | Remove hopper stopper. |
| | No beans in hopper. | Add beans. |
| | Partially blocked grinder spout. | Clear blockage. |
| | Clogged funnel. | Clear blockage. |
| | Hopper stopper installed. | Remove hopper stopper. |
| Too much coffee being poured | Flowmeter failure | Diagnose using TEST ROUTINES / BREW WATER VALVE . Verify in mL count increments. |
| | Water volume setting is too high. | Verify proper setting for water volume. |
| Failing of coils or components in controls | Excessive voltage in control. | Confirm the stray voltage in site's neutral or ground circuit. Have customer resolve. |

Flavor System

| SYMPTOM | PROBABLE CAUSE | CORRECTIVE ACTION NEEDED |
|-------------------------------------|--|---|
| Air bubble(s) in flavor tube | Loose fitting. | Check all fittings are secure and properly connected. |
| | Flavor box problem. | Open flavor box and check to ensure bag has no punctures. |
| Leak in flavor tube(s) | Break in flavor tube. | Check flavor tube(s) for breaks. |
| | Faulty fittings. | Verify fittings properly connected. |
| | Puncture in flavor bag. | Check flavor bag for puncture. |
| Kink in flavor tube(s) | Incorrect placement of flavor tubes and/or flavor box. | Gently smooth out flavor tube(s). Remove flavor tube, first, if necessary. |
| | Box resting on tube | Lift box and remove tube from incorrect position; correctly position flavor tube. |

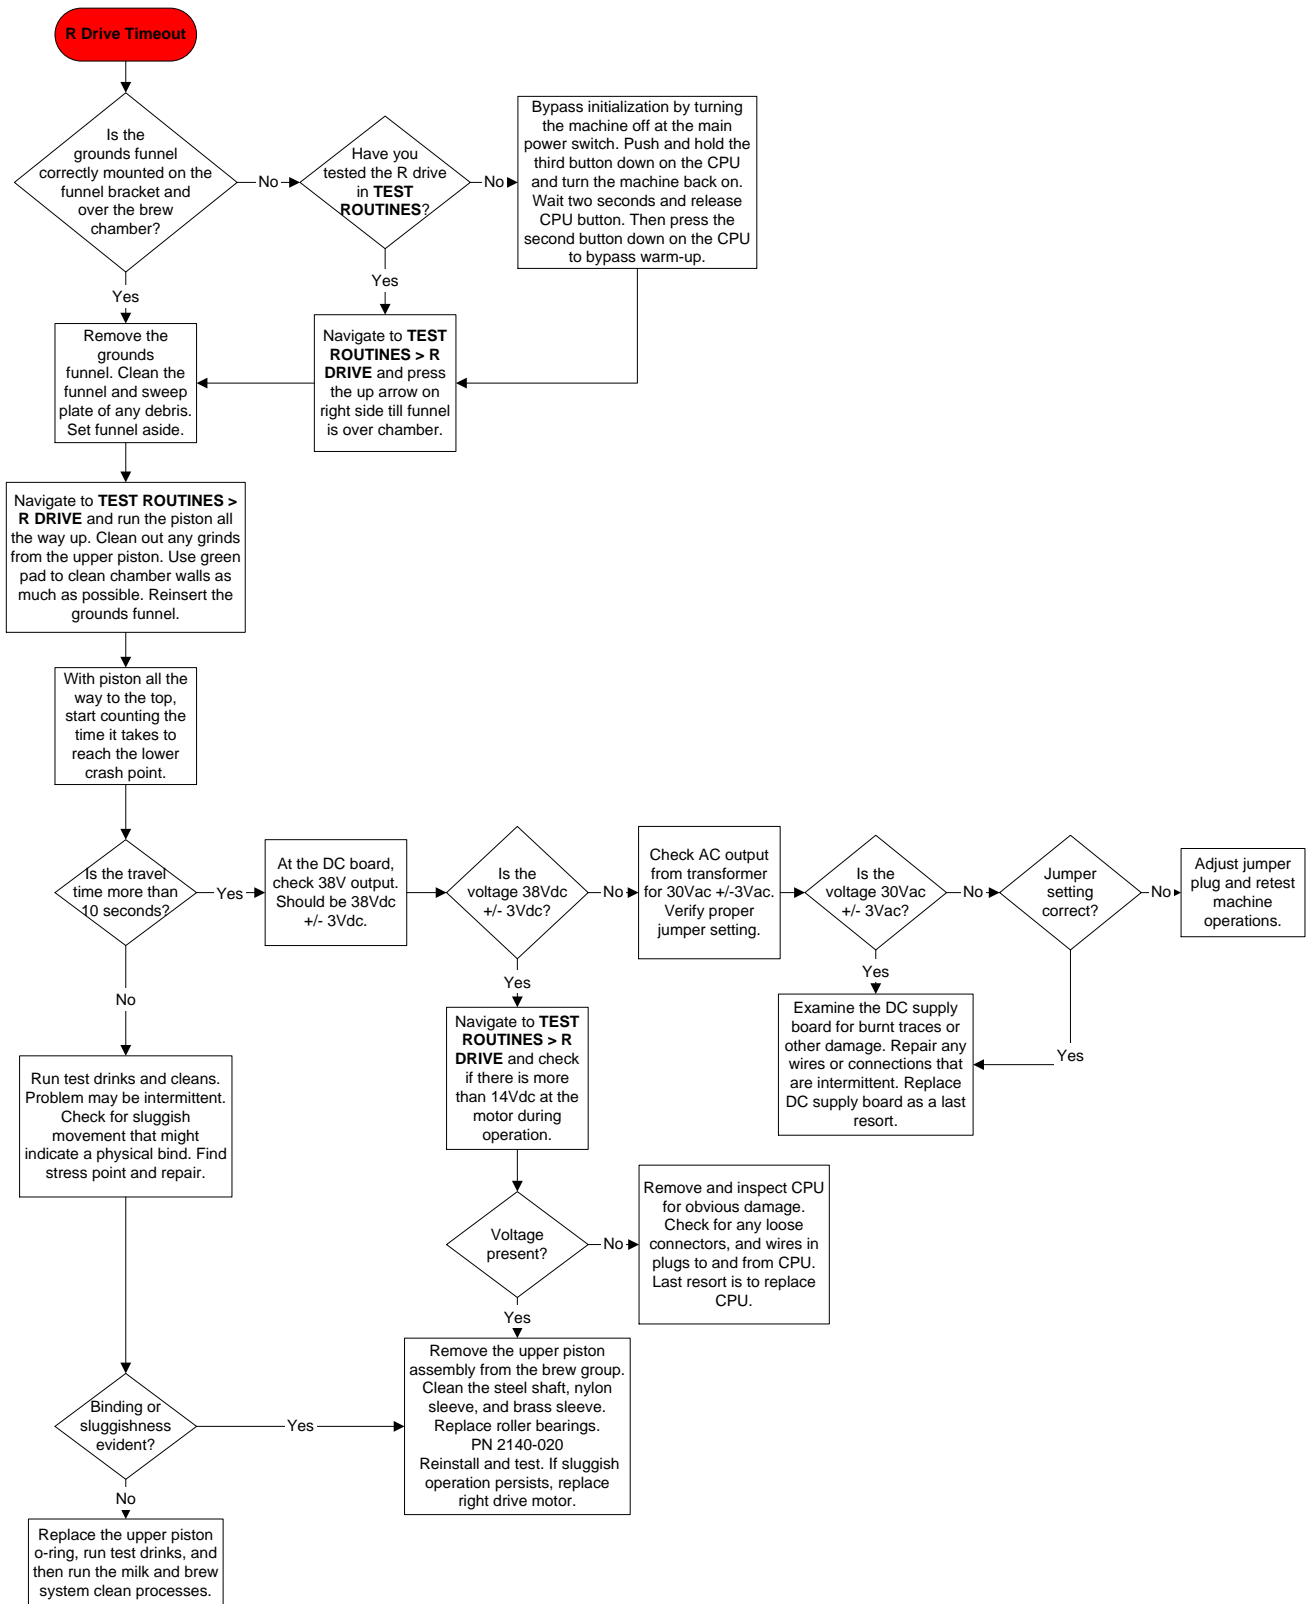

Milk System

| SYMPTOM | PROBABLE CAUSE | CORRECTIVE ACTION NEEDED |
|--|--|---|
| Drinks poured too hot | Steam too high | Check steam pressure. Check steam setting. |
| | Open air flow | Check air flow. |
| Milk won't foam | Milk got too warm, then cold (shocked) | Replace milk supply with fresh milk. Ensure the milk is not past its expiration date. Restock as necessary. |
| | Air vent needle missing | Check to verify air vent needle is properly attached. Verify correct air vent needle is attached to valve. |
| | Out-of-date milk | Replace milk supply with fresh milk. |
| Milk spraying during dispensing | Dirty or clogged product nozzle | Check for restrictions to product nozzle. Check for dried milk or debris build-up in product nozzle. |
| Too much or too little foam | Air gate valve stuck | Check air, steam, and air gate valves. |
